## IBM kick-starts SAA onto office track

### Migration worry mutes user praise

BY STANLEY GIBSON  
CW STAFF

**NEW YORK** — It will not all ship right away, there is no Unix support, and multivendor environments are left out in the cold. Nevertheless, users enthusiastically hailed IBM's much-anticipated Officevision last week.

Most said they perceived the announcement exactly as IBM intended — proof that IBM Systems Application Architecture standards and protocols can help tie together their corporate systems. A chorus of users joined third-party vendors in

welcoming the functionality of Officevision, which they agreed was long overdue.

"What IBM is doing is great. We've been looking for that seamless environment for some time," said George Conniff, manager of information services at Bechtel Group, Inc., in San Francisco. However, Conniff and other users face prickly migration questions surrounding current office automation systems and non-IBM equipment.

In general, users said IBM's prices were not out of line, although some questioned whether the addition of IBM's OS/2

braced the "L" word — LANs. After years of diminishing local-area networks as more extensive networks of workstations, IBM last week unwrapped Officevision, SAA-compatible software anchored by an IBM OS/2 Extended Edition-based network and LU6.2 connectivity.

The major components of the IBM announcement are the following:

• Officevision for the four current SAA strategic platforms: MVS, VM, OS/400 and LAN—ware features electronic mail, calendaring and a graphical interface and also provides for communications and data trans-

portation Manager interface was worth the price. IBM Vice-President Joseph Guglielmo said an eight-node local-area network configuration will cost about \$8,000 per user for hardware and software.

Clearly, IBM expects Officevision to boost its own sales.

"Cooperative processing will offer users more functionality, and will require more mainframe MIPS and storage," says Guglielmo. "And IBM Vice-President Earl Wheeler, chief of SAA development, Wheeler added, however, that SAA is a

*[Continued on page 119]*

### Buying into Officevision

	<b>OS/2</b> • Standard Edition Version 1.2: \$340 • Extended Edition Version 1.2: \$400
	<b>Officevision/LAN Series</b> • OS/2: \$750 per workstation • DOS: \$210 per workstation
	<b>Officevision/VM</b> • \$2,000 to \$3,000 for paid-on license or \$1,000 to \$12,400 plus annual license fee of \$350 to \$3,210
	<b>Officevision/MVS</b> • \$15,120 to \$15,600 plus annual license fee of \$2,470 to \$9,000

## EXECUTIVE BRIEFING

■ SAA arrived with IBM's introduction of Officevision last week. The product line, which will become available over a two-year period, unites OS/2-based workstations, servers and large systems in a cooperative processing model for electronic mail, calendaring and other office functions. **Page 1.** Users were upbeat about Officevision's potential, though some were concerned about migration from existing office systems. **Page 1.** IBM also gave its long-awaited endorsement to Ethernet and Microsoft's LAN Manager, confirming two years of speculation. **Page 120.** A raft of independent vendors were on hand to endorse SAA and introduce cooperative processing software ranging from human resources to accounting and insurance. Deliveries are scheduled to begin in the fourth quarter. **Page 119.** Users say Officevision may finally give them a reason to go to OS/2. **Page 120.**

■ More companies take users off the dole, giving them real control over their own pieces of the corporate information resource. Lack of standards hasn't stopped IS operations from forging ahead with global networks, distributed reporting and plans to migrate application development into heterogeneous. **Page 71.** Some companies have begun to migrate IS staff into business units, and many more are considering such a move. In many cases, these transferred personnel are reporting to business managers. **Page 84.**

■ A rogue application crashed American Airlines' flagship Sabre reservation system earlier this month. Despite heavy backup and security, American's network was victimized by a stray program that rendered disk drives useless and shut down the system for 13 hours. **Page 1.**

■ Buyouts lead to reorganization in corporate IS at two major organizations. The top IS executives at Ensho and China Pacific announced their departures as their highly decentralized departments were eliminated. **Page 8.**

■ Borg Warner scaled down from a 4341 to PC LANs after its takeover defense forced a 50% cut in the IS budget. Though the applications strained 80386 servers to the limit, the move is working, and users seem happy with the friendlier interface. **Page 63.**

■ Divide and compute, says the Port of Seattle,

which moved from an aging Burroughs mainframe to a network of eight Wang minis. Officials say the network is cheaper and easier to upgrade. **Page 25.**

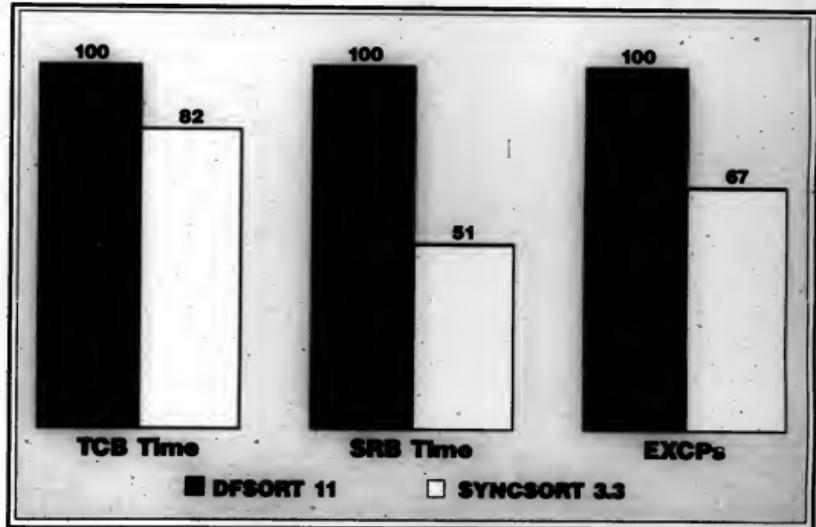

■ Tight management enables Paine Webber to save an expected \$10 million in communications costs this year or about 10% of its budget. The process involved reviewing targeted expense items, getting tough with vendors and developing project schedules. **Page 53.**

■ Cray crosses the largest remaining U.S. supercomputer market as a company to develop a supercomputer based on the highly experimental gallium arsenide chip. Seymour Cray will head the venture, his third start-up. Analysts largely praised the move. **Page 6.**

■ Unix lovers perk up as OSF and Unisys International join X/Open Consortium, raising hopes that they are moving closer to putting differences behind them. **Page 12.**

■ Organizing a department means taking into account the structure of the entire company — does it follow along business or functional lines or a combination of the two? Other factors to consider: striving for stability but realizing that change is inevitable, providing for departmental strength that goes beyond the individual employee, practicing political as well as technological sensitivity and allowing for organizational evolution that occurs as the company evolves. **Page 87.**

# Prime to MAI: Fish or cut bait

BY NELL MARGOLIS  
CW STAFF

**NATICK, Mass.** — Battured by seven months of fending off a hostile takeover by MAI Basic Four, Inc., Prime Computer, Inc. last week fired a shot that could be either its best or its last.

In a letter sent to MAI Chairman Bennett S. LeBow, Prime Chairman David Dunn challenged the would-be acquisitor to come up with the financing for MAI's valued \$20 per share, or approximately \$970 million, tender offer by June 2.

If Lebow rejects the money, Dunn said, Prime will disavow its poison-pill shareholder provision — now amended to let MAI complete the purchase, if possible — withdraw its opposition and let the shareholders resolve what has become one of the bloodiest takeover battles in the computer industry.

If Prime calls MAI's bluff, however, Dunn said, then Prime expects MAI to fold it off and let Prime get back to business.

MAI responded with a terse statement that it was "evaluating all aspects of its offer ... in light of Prime's recent flurry of public announcements." These announcements included a weakened quarterly earnings report and quarterly financial projections through 1990, which were attributed to the costs of defending itself against the takeover.

Wall Street reacted swiftly, hammering Prime stock on the belief that MAI will either back off from the \$20 figure or drop its offer altogether. MAI had not been available for comment.

An indication that Wall Street could be right came later in the week, when MAI declined Prime's offer of access to confidential financial information. According to Prime, MAI stated that a clause in the confidentiality agreement binding MAI to its bid was unacceptable.

"This is becoming very interesting in the Oriental sense," said Steven Duke, an analyst with Shearson Lehman Hutton, Inc., referring to the ancient Oriental curse, "May you live in interesting times."

Analysts agreed that if MAI does reduce its price, the chance of Prime's shareholders accepting the deal is minimal. Moreover, Duke noted, "If Lebow lowers the price, he's going to find himself back on square one, battling this whole thing through the courts." With speculation and uncertainty, he said, "Only one thing is clear: This battle has been going on too long."

# HP pushes DAT drive standard

BY J.A. SAVAGE  
CW STAFF

**SAN DIEGO** — Hewlett-Packard Co. is the second big company to give a shove to one of the two factions attempting to standardize digital audio tape (DAT) for data backup.

HP will today announce its first DAT drive for the OEM market based on Data Digital Storage standards. Sony Components Products Co. last month introduced SDT-1000, based on the same standard.

DAT uses tape cartridges the size of videocassettes and recording technology like that of a home videocassette recorder. It can store more than 1 GB of data on one cassette and will primarily serve as archival backup for low-end minicomputers and high-end personal computers.

Speed is the trade-off. Seek times "are about 1,000 times slower than a Winchester drive," said Bert Vermeulen, HP's product manager for DAT.

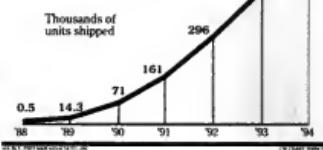

In the last year, two standards for DAT have evolved that address two separate storage needs. Data Digital Storage, developed by HP and Sony, uses sequential recording for straightforward backup, and any changes would have to be ap-

plied. Data/DAT allows for updating and placing of data directly into the data set.

The transfer rate of Data Digital Storage is higher, at 183K bytes/sec., while Data/DAT reaches 177K bytes/sec. at best, according to Lee Eizer, president of Data Storage Concepts, Inc., a Santa Barbara, Calif.-based storage consultant. Data Digital Storage holds about 1.3G bytes of data while Data/DAT holds about 1.2G bytes. Both use 4mm tape cassettes.

The two standards are coming from different directions, said Bob Abraham, an analyst at storage consultant Freeman Associates in Santa Barbara, Calif.

**Take DAT!**  
*Shipments of data drives using digital audio tape technology are projected to increase rapidly during the next few years*

ure was not discovered for nearly an hour.

**Wake-up call**  
"Our reaction was one of absolute horror," Juracek said, who learned of the outage after being awakened by an emergency phone call on May 12. "It was our worst nightmare," he added, "especially because we take enormous pride in the quality we produce in Sabre's service level."

The culprit was a "core-walker," Juracek said. "We had a program that was changed erroneously by another program. The changed piece of information in it did something we never intended for it to do and that was to erase critical storage data on 1,060 disk drives."

The erroneous program "walked" though Sabre's memory, stripping away the digital information on each disk volume and making it impossible to address any of Sabre's disk drives. While the Sabre disk farm contained 700G bytes of data, just 2,500 records were lost, Juracek said last week. The total amount of memory lost was less than 1M byte, he claimed.

The problem that was changed was a control field in the formatter utility, he explained. The ACP operating system, overwhelmed by its inability to address the disk drives, collapsed nearly instantaneously, Juracek added. But the cause of the fail-

pended. Data/DAT allows for updating and placing of data directly into the data set.

"The transfer rate of Data Digital Storage is higher, at 183K bytes/sec., while Data/DAT reaches 177K bytes/sec. at best, according to Lee Eizer, president of Data Storage Concepts, Inc., a Santa Barbara, Calif.-based storage consultant. Data Digital Storage holds about 1.3G bytes of data while Data/DAT holds about 1.2G bytes. Both use 4mm tape cassettes.

The two standards are coming from different directions, said Bob Abraham, an analyst at storage consultant Freeman Associates in Santa Barbara, Calif.

# What number does The Hartford call for application development productivity insurance?

**1-800-345-DBMS.**

**T**wo years ago, The Hartford's Group Life & Health Insurance Operation decided to modernize 39 company-critical information systems. They selected Oracle Corporation. Why?

Because Oracle promised tools that would enable them to quickly develop applications with customizable user interfaces, non-procedurally.

Because Oracle promised to become the world's largest relational DBMS company.

Because Oracle set out to be the number one software company in customer satisfaction.

Oracle delivered it all.

"ORACLE® tools increased our productivity 300% over other application development tools."

Jim Bosco, Project Manager  
The Hartford Insurance Group

*"With SQL\*Forms®  
and ORACLE,  
we've developed over  
one-thousand interactive  
screens, without  
writing a single line  
of procedural  
language code."*

Dave Annis, Assistant V.P.  
The Hartford Insurance Group

And today, over 50,000 customers have used Oracle tools to build powerful, world-class applications. Applications that run on everything from an IBM PC to a Sun workstation to a DEC VAX to an IBM mainframe.

Get your own  
productivity insurance

Reserve a seat in the next free Oracle data management conference in your area. Find out how Oracle's CASE and application tools can instantly improve your company's productivity. To insure yourself a reservation, call today. Conference seating is limited.

# Cray casts out founder's unit

BY JAMES DALY  
CWTSTORY

**MINNEAPOLIS** — The dynamics of the supercomputer industry were abruptly altered last week when Cray Research, Inc. unveiled a restructuring plan that will divest off its books approximately \$50 million in machines, muscle and material and create a new company headed by founder Seymour R. Cray.

The move is an attempt to soften the wallop that research costs have inflicted on Cray's recent profits by dividing the company into two technological camps, according to Cray officials.

While Cray Research's efforts will continue to focus on its silicon-based product line, the newly formed Cray Computer Corp. will emerge from the experimental gallium arsenide chip technology now being worked on at the Cray-3 development lab in Colorado Springs. "If we were a 'normal' company, we'd be tempted to choose between the two projects," said Chairman and Chief Executive Officer John A. Rohlwagen. "But it's clear that both of them offer tremendous exciting capabilities."

Seymour Cray to head supercomputer spin-off

of its assets, pending receipt of a favorable tax ruling from the Internal Revenue Service. Cray Research will also provide Cray Computer with up to \$100 million in operating funds during its next two years.

Rohlwagen added that Cray Research will distribute 90% of the stock in the new company to its shareholders on a tax-free basis and retain a 10% interest.

Seymour Cray is expected to be assisted by Neil Davenport, vice-president of Cray's Colorado operations, who will become Cray Computer's chief operating officer.

Analysts saw the move as a positive one that signals a maturing

of its assets.

Rohlwagen says ETA deserves affected decision

## Let bygones be bygones

Control Data Corp. said it will market supercomputers from Cray Research, Inc., under a joint arrangement announced by the two companies last week.

The pact, not yet formalized, was announced May 16, almost one month to the day after CDC's decision to fold its money-losing supercomputer subsidiary ETA Systems, Inc. Meanwhile, former rival Cray had news of its own, announcing that it is splitting into two companies (see story above).<sup>1</sup>

James E. Ousley, president of CDC's Computer Products Group, said CDC will act as the prime contractor for customers requiring workstations, mainframes and supercomputers. Cray "will be the subcontractor for the supercomputer part," he said.

Regarding users of CDC's defunct ETA10 line of supercomputers, Ousley said CDC will stand by its commitment to support ETA hardware for five years and ETA software for three years.

In addition to the joint marketing pact, the two firms will explore opportunities to develop, enhance and market new and existing products, specifically looking for better ways of interfacing Cray supercomputers with Cyber miniframes and workstations. Ousley said some of these capabilities already exist in CDCNet, CDC's networking product, and that these will be enhanced.

ELLIS BOOKER

Although both machines are expected to be comparable in performance, they are quite different in approach. Cray Research's development work on its next-generation C-90 will be silicon-based and promises a more direct, commercial success, while Seymour Cray said he believes the still-unproven gallium arsenide technology will be the linchpin in the next generation of supercomputers.

Cray Research will shift the money and equipment, which is about 5% of its assets, pending receipt of a favorable tax ruling from the Internal Revenue Service. Cray Research will also provide Cray Computer with up to \$100 million in operating funds during its next two years.

Rohlwagen added that Cray Research will distribute 90% of the stock in the new company to its shareholders on a tax-free basis and retain a 10% interest.

Seymour Cray is expected to be assisted by Neil Davenport, vice-president of Cray's Colorado operations, who will become Cray Computer's chief operating officer.

Analysts saw the move as a positive one that signals a maturing

of its assets.

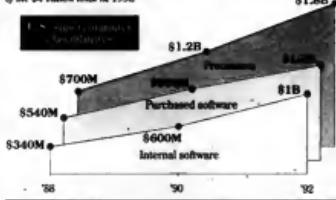

The company also unveiled a Fortran compiler intended to make the systems embrace a wider volume of the supercomputer market.

Company President Sherry Handler said the new machines, with what she called the lowest price/performance ratio in the supercomputer industry, are targeted specifically at the university market. Handler said she believes that it is vital for Connection Machines to be available on campuses, where the next generation of technical experts will get to work with them.

"We need to create an environment for people to accom-

## Super market

Rapid growth is projected in the U.S. market for supercomputers and software, although internally developed software will represent one-fourth of the \$4 billion total in 1992.

nounced that it was terminating its 6-year-old supercomputer unit ETA Systems, Inc. because it could not afford the financial drain.

Rohlwagen admitted that the demise of ETA was a factor in the decision to split up the company.

"It's critically important that the U.S. have a supercomputer industry, and by definition, the only way that we have an industry is if there is more than one vi-

able competitor," he said.

But some observers said such claims are spurious and suggested the move may have been prompted by Cray Research's reluctance to appear as a monopoly. "It's face-lifting," said Liana Kartashev, president of the International Supercomputing Institute in St. Petersburg, Fla. "It's like having one chess player controlling both the white pieces and the black pieces. That's not competition."

## Thinking Machines undercuts supers

BY GLENN REIFKIN  
CW STAFF

Making good on a 2-year-old promise to establish a new price/performance standard for supercomputers, Thinking Machines Corp., the Cambridge, Mass.-based supercomputer maker, last week introduced two scaled-down models of its innovative Connection Machine, which features 64,000 processors working in parallel.

Thinking Machines introduced two models dubbed the CM-2A, each of which are scheduled to ship this month. A 4,096-processor system has a peak hardware performance level above 1G floating-point operations per second (GFLOPS) and starts at \$500,000. The 8,192-processor version has a peak performance level above 2G GFLOPS and is offered fully configured at \$1.06 million.

The company also unveiled a Fortran compiler intended to make the systems embrace a wider volume of the supercomputer market.

Company President Sherry Handler said the new machines, with what she called the lowest price/performance ratio in the supercomputer industry, are targeted specifically at the university market. Handler said she believes that it is vital for Connection Machines to be available on campuses, where the next generation of technical experts will get to work with them.

"We need to create an environment for people to accom-

plish software experience using the machines," said Thinking Machines Vice-President Richard Clayton, who acknowledged that the company's long-term goal is to move the machines out into the business arena.

### DEC deal

To facilitate the push onto college campuses, Thinking Machines also announced a joint venture with Digital Equipment Corp. The firms will configure a CM-2A with a VAX front end at its special price and supply it to 25 universities. The schools will be required to submit research proposals that focus on data parallel processing. Thinking Machines and DEC will choose the recipients.

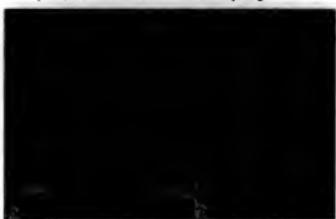

Thinking Machines claims to have 10% of the supercomputing market, second only to Cray. Handler said the company has installed 35 Connection Machines in 2½ years, and the number of

users is doubling every year.

According to Richard Shaffer, a consultant at Technologic Partners in New York, CM-2A will not affect the supercomputer market very much. He pointed out that because the architecture and software of the Connection Machine is so vastly different from the market-dominant Cray, it will present little competition in the short run.

"Even people who have tried to do what Cray does have found it tough going, and the Connection Machine is not mainstream supercomputing," Shaffer said.

For data-intensive computing problems, multi-processor parallelism allows a much faster approach to a problem. "The Connection Machine is just at the beginning of the power curve," said Steven Barnard, senior computer scientist at SRI International, Inc. in Menlo Park, Calif. "I'd much rather hitch my carriage to this kind of computing."

CENTER

## NEWS SHORTS

### OSI groups agree to cooperate

IBM may finally join the Open Systems Interconnection/Network Management Forum to merge its own proposed program toward standardizing interoperability between one of three-way agreement finalized last week between the forum and two other major standards bodies: the Corporation for Open Systems and the European Standards Promotion and Application Group. IBM declared several months ago that a formal agreement among the three bodies was its prerequisite for becoming a member of the forum, which hopes to ensure consistent protocol sets and eliminate functional redundancy through the pact.

### Hello, this is the Pope

Two California companies recently introduced nearly identical services that can deliver the voice of Pope John Paul II to anyone— anyone with a few bucks, that is. Voicesonic International, Inc. and Languerent, Inc., each developed systems that transmit the Pope's daily messages, which are also heard on the Vatican's radio station. With Voicesonic International's service, a caller uses an international phone number to link into the Vatican's voice-mail system and is charged a regular international call rate. Languerent uses a 900 telephone number, charging 65 cents per minute. The company picks up the radio broadcast from the Vatican and then provides the taped message to callers.

### Transportation head pangs merger

U.S. Secretary of Transportation Samuel K. Skinner last week urged the U.S. Attorney General to decline to prosecute the proposed merger of American Airlines and Delta Air Lines, contending that the structure of the proposed merger of the CRSA "poses a substantial likelihood of producing an adverse effect on airline competition."

### No sign Mueller will be tried in U.S.

Although accused "techno-hands," Richard Mueller surfaced in his native West Germany two weeks ago, it seems unlikely that U.S. authorities will be able to bring him to trial. "He's a German citizen. It would be nice if he were extradited [to the U.S.], but it doesn't look like that is going to happen," a source at the U.S. Customs Service said. Mueller was indicted last year for the alleged illegal diversion of Digital Equipment Corp. VAX computers to the Soviet bloc.

### Mips to supply Pyramid

Pyramid Technology Corp. may give commercial legitimacy to Mips Computer Systems, Inc.'s Unit-based reduced instruction set computing systems. Last week, Pyramid announced that it would sell Mips' computers as the low end of the company's commercial Unix line. Pyramid had hoped to reach such an agreement with Sun Microsystems, Inc., "but that fell apart," according to Richard Roth, Pyramid's director of strategic marketing.

### RTI upgrades Ingres

Relational Technology, Inc. last week upgraded its Ingres SQL relational database management system with an enhancement of Ingres' professional applications development tools.

### Curious talker: Smellie

By the end of the century, if you live in the Kingdom of Thailand, government officials will know who you are, where you live and what you look like. Control Data Corp., earlier this month won a contract from Thailand's Ministry of the Interior for two of its Cyber 9000 mainframes and IBM/DB relational databases to handle the innovative census program, which will store information on 60 million people and 10 million Thai households. The mainframes will be hooked to optical disks containing photographs of all Thai citizens beginning in 1991.

## Acquisitions take toll on IS

BY CLINTON WILDER  
CW STAFF

The top information systems executives at Emhart Corp. and Chicago Pacific Corp., two major manufacturing companies acquired in recent months, will leave their jobs this summer when their corporate IS departments are eliminated by the respective acquirors.

David Dandridge, 52, vice-president of IS at Emhart, will depart July 1 when Emhart closes the corporate office housing Dandridge's centralized IS consulting group. Black & Decker Corp. was bidding war in March to acquire Emhart for \$2.8 billion. H.K. Ingemannsen, 62, will retire as Chicago Pacific's manager of IS June 1 after a 22-year career at the company. Chicago Pacific, a former railroad now primarily in the home appliance and furniture businesses, was purchased by Maytag Corp. in a \$1 billion friendly transaction completed in January.

Emhart and Chicago Pacific have decentralized IS operations with small corporate staffs.

Emhart, with \$2.76 billion in 1988 sales, has 25 IS employees at its Farmington, Conn., headquarters, and Chicago Pacific, a \$1.5 billion firm, has just two corporate IS executives directing a worldwide staff of 150.

Dandridge said he will not seek another similar position right away. Before joining Emhart seven years ago, he worked in IS for three companies that have been either acquired, taken private or broken up. Borg Warner Corp. [see story page 63], J.C. Penney and Allis-Chalmers.

"Corporate America is undergoing a lot of change, and [IS executives] are no different from

anyone else," Dandridge said. "There certainly aren't bad feelings. That's life in the big city."

Baltimore-based Black & Decker had a change of the IS guard last September when Vice-President of Worldwide IS Sidney Diamond replaced Vice-President of MIS James Barcus. Diamond refused to comment on IS changes at Emhart.

Maytag will close Chicago Pacific's downtown Chicago office, which employs 75 people, only a handful of whom have chosen to relocate to Maytag's headquarters in Newton, Iowa, Ingemannsen said. Dale Wilke, Maytag's director of corporate IS and telecommunications, will take over responsibility for Chicago Pacific. Dale Wilke and IS employees at Chicago Pacific's subsidiaries, of which Hoover vacuum cleaners is the largest, should not be affected by the merger.

may exist in our federal computer security laws," he said in a statement.

No federal statute specifically addresses computer viruses, although two antivirus bills have been introduced in the House and some virus cases can be prosecuted under the Computer Fraud and Abuse Act of 1986.

FBI officials testified that they intend to vigorously prosecute hackers who plant computer viruses, but they added that the job is exceptionally difficult.

Kenneth Walton, deputy chief of the FBI's criminal investigation division, said, "Computer viruses are tough to investigate and prosecute because existing statutes require the authorities to prove criminal intent and damage. "Those are the two swing points that make investigations very difficult," he said.

Viruses often are designed to prevent detection, and they may undergo various permutations and spread over wide geographic areas, said FBI Director William S. Sessions. In addition, system owners are sometimes more concerned with repairing the damage — or hiding their embarrassing lack of security — than with prosecuting the offenders, officials said.

So far, the FBI has investigated only two virus cases. One involved the hacker known as Shadow Hawk, who was sentenced in February [CW, Feb. 20], and the other is the investigation of the Internet worm.

Sessions asserted that FBI agents have enough computer literacy to identify computer crimes and call in outside technical experts to investigate. However, he said, it may become a problem getting enough experts to deploy "if this potentially explosive new area of computer activity continues to expand."

## Senate takes tentative look at virus legislation

BY MITCH BETTS  
CW STAFF

WASHINGTON, D.C. — U.S. Sen. Patrick J. Leahy (D-Vt.), taking a cautious approach toward antivirus legislation, last week asked the Senate Bureau of Investigation to provide a recommendation on whether existing federal laws are adequate for prosecuting computer virus attacks.

Leahy, chairman of the Senate Subcommittee on Technology and the Law, made the request during a subcommittee hearing aimed at exploring the scope of the virus problem.

The star witness was Clifford Stoll, a computer astronomer who had experience with the Internet worm last November [CW, Nov. 7] and discovered a West German computer spy ring [CW, March 6].

Stoll explained how the hackers — and around-the-clock effort to trace them — had disrupted his astronomy research, his private life and his trust in the computer community.

He stressed that the Internet worm, which clogged his computer at the Lawrence Berkeley Laboratory and prevented him from doing research for two days, was no harmless prank.

*Leahy is not rushing to pass an antivirus law*

Stoll likened the hackers to "vandals . . . who want to wreck our communities."

Leahy said malicious viruses are criminal and intolerable, but he added that he is in no rush to pass legislation that might inadvertently stifle experimentation and the free exchange of information over computer networks and bulletin board systems. "We are probably wise to go slowly and carefully," he said.

Sen. Gordon J. Humphreys (R-N.H.) urged Leahy to act faster. After receiving expert testimony, "we should promptly turn our attention to whether specific legislation is needed to close any dangerous gaps that

# SATISFACTION GUARANTEED

If you have been searching for a software company that can provide you with a wide range of software solutions, backed up by first rate support, we invite you to join the over 6,500 MVS, DOS and VM users who have found long term software satisfaction with SEA. Since 1982, we have been developing products based on your input and backing these products with support you can count on 7 days-a-week, 24 hours-a-day. The results have been impressive for both us and our users. With products licensed at one in every four mainframe sites worldwide, SEA software has set new standards for efficiency and performance. Our over 6,500 licensed users include 9 of the Fortune 10, 85% of the Fortune 500 and thousands of other installations of all sizes and configurations. An equally important factor in measuring our success is our high level of user satisfaction, in which we take great pride.

## SEA PRODUCT GROUPS

### **Operations Automation Group**

SEA provides a complete line of operations automation products covering all critical areas. We are the only company that provides such a complete line of operations automation software backed up by first rate technical support. With over 2,500 users choosing SEA as their single source for operations automation software, we have assumed a position of leadership in the field. Many users tell us the reason they have selected our products is superior support, as well as our integrated approach to long term product development.

**ODDS - Master Console Management.**

**SAIERS - Sysout, Syslog and JCL Management, Viewing, Archival and Retrieval.**

**TRMS - Report Management and Distribution.**

**CSAR - Automated Job Scheduling MVS-DOS-VM.**

**TRAMS - Data Transmission Management System.**

**QUICK - Data Compression/Decompression for increased**

**TRANS - data transmission between mainframes or miniframes and PC networks.**

**SYNTHETIC - Functionally verifies operating system and**

**JOBSTREAM hardware changes before production**

**implementation.**

**KEYS - A keyword assisted search program for software and hardware inventory management.**

### **Application Development Group**

SEA's application development products, used at over one thousand locations, have helped increase programmer and program productivity. They aid in application development for CICS, database systems and monitor program performance and operational dependencies.

**PRO-2 - Application Development MVS-DOS.**

**PROFILE - Performance Measurement and Analysis.**

**SEA also offers a complete line of products for the DEC/VAX environment  
including DBMS/4th GL and output queue optimization.**

SEA has products that will save budget dollars and increase efficiency, whatever your installation's size or configuration. No other software company even comes close to matching our combination of a comprehensive line of high quality software solutions, backed up by the highest levels of technical support. We invite you to join the thousands of installations who have found long term software satisfaction with SEA products.

**For further information regarding any of the above call 1-800-272-7322.**

# SEA

*Products Licensed In Over 40 Countries*

### **DASD/Data Management Group**

SEA's DASD/Data management tools have become corporate standards, used in one out of every five MVS data centers worldwide. Our DASD management products provide dramatic savings under virtually any configuration and have set a new standard for efficiency and high performance.

*We take very seriously our claim of being able to significantly decrease DASD expenditure in any MVS configuration. Our unique approach enables us to guarantee you significant savings in both short and long-term DASD cost. Take the opportunity to trial our products with no obligation and we will provide you with the same guaranteed results achieved by over 4500 users, regardless of your installation's size or configuration.*

**PDSFAST - High speed DASD Management,  
PDS Management, 100% IEBCOPY  
replacement.**

**FASTGENR - High speed replacement for IEBGENER.**

**PDSUPDATE - High speed global JCL/PDS editor.**

### **VSAM Group**

On the average, VSAM consumes over one-third of all DASD and greatly impacts performance at many installations. SEA's VSAM products have helped many users reduce VSAM space requirements by over 25% while greatly increasing VSAM performance.

**VCFL/L - ListC replacement, VSAM tracking and reporting.**

**VCFM/M - Automated VSAM optimization and allocation.**

**VCFD/D - VSAM data manipulation.**

# IN ALL FAIRNESS, YOU SHOULD READ WHAT ASHTON-TATE IS SAYING BEFORE YOU PURCHASE ORACLE.

## Ashton-Tate Fights SQL Bugs *Same Query Run Twice Can Result in Different Replies*

Ashton-Tate last week announced that it has found a problem of "unreliable" results in Oracle's PC version of its DBMS product.

The error is in the PC version of Oracle 7.0, which Ashton-Tate says is the first version of Oracle to run on PCs. It occurs when users run the same query twice in a row, and when data is returned in different orders.

For example, if a user runs a query that returns 10 rows, and then runs the same query again, he may get 10 different results, or, for example, at a

given user-defined sequence. (See "Ashton-Tate" on page 2.)

Ashton-Tate does not plan to issue a statement on the problem until it has more information, according to spokesman Steve Koenig.

Ashton-Tate is a division of Computer Associates International.

Through Ashton-Tate, Oracle says it is changing the way it handles PC SQL products. It will continue to support Oracle's PC SQL products and continue to develop them, but it will no longer support Oracle's PC SQL products.

"The SQL in ORACLE is not yet matured enough," says Koenig. "We are continuing to work on it." He adds, "We are continuing to develop PC SQL products, but we don't yet have the resources to do so."

In addition, Ashton-Tate says it will no longer support Oracle's PC SQL products.

*See ORACLE, Page 8*

PC Week, January 9, 1989

Oracle developed the first commercial SQL database over 10 years ago.

And the first SQL database for the PC over 4 years ago.

It's called Professional ORACLE®.

It has the most up-to-date, most powerful and most complete set of application development tools available.

Like SQL\*Forms®, SQL\*Menu®, SQL\*Plus® And SQL\*ReportWriter™.

It's based on ANSI standard SQL and runs on PCs, minis and mainframes.

And it works.

To order Professional ORACLE for the PC, call 1-800-ORACLE1, ext. 8147.

It's \$1,299, and comes with a 30-day, money-back guarantee.

# IBM backs Carnegie spin-off

BY AMY CORTESE  
CW STAFF

PITTSBURGH — A new company funded by IBM was formed last week to develop Unix-based distributed computing and transaction processing software.

Transarc Corp. will base its products on research conducted at Carnegie-Mellon University's Information Technology Center.

Alfred Z. Spector, former director of the center and associate professor at Carnegie-Mellon's School of Computer

Science, is president of the new firm.

Neither IBM nor Transarc would disclose details of IBM's investment other than to say that IBM will have a significant equity interest. An IBM spokesman said that the investment will

result in leading-edge technology for IBM's AIX customers.

The deal follows in the wake of several recent investments in technology firms during the past several months, including Metaphor Computer Systems, Inc. (see story page 121) and Nest, Inc.

Transarc will capitalize on two university research efforts. One, the Andrew File System

(AFS), is a six-year joint effort between IBM and Carnegie-Mellon to connect the university's many computers and used by thousands today.

Transarc will also develop distributed transaction processing software based on Canceled, the Carnegie-Mellon Low Overhead Transaction System. The ideas stemming from that project will be the basis of a product for developers to build transaction processing applications.

Philip L. Lehman, Transarc's director of marketing for file systems, would not say when Transarc will have products on the market, but he indicated that the company will be announcing something "in a month or two." The firm has a staff of 20 and expects that number to grow to 60 within a year.

Transarc will develop products for many versions of Unix, although it specifically named AIX.

Lehman said the company will be heavily involved in the development of Unix standards and hinted that it will join one or more of the standards groups, such as X/Open Consortium Ltd.

## Unix rivals get together

A growing attitude of cooperation among rival Unix groups reached new heights last week as X/Open Consortium Ltd. admitted the Open Software Foundation (OSF) and Unix International as full board members.

Both the OSF and Unix International have supported X/Open since their inception, but their joint membership formalizes those commitments and boosts X/Open's role as a unifying force in setting Unix standards.

The OSF's initial bid for membership earlier this year stirred controversy among the X/Open board, whose constituency is split almost evenly between OSF members and Unix International members. Some opposed the OSF's acceptance because its members are already represented on the X/Open board individually, and acceptance would give the OSF an unfair advantage, they said. But the inclusion of Unix International maintains the status quo.

The action solidifies support of X/Open's Common Application Environment (CAE), a set of comprehensive standards intended to provide applications portability across all systems that conform to those standards. CAE is widely supported in the U.S. and internationally and has been specified for major government procurements. Ultimately, CAE could provide portability across any underlying operating system.

# Six Reasons to Choose the SAS® System for Your Workstation.

Data Entry, Data Management, and Retrieval

# Make That Seven.

A free menu-driven interface to  
SAS System applications

Discover the potential of workstation computing with the SAS System. No other software brings you more choices for managing, analyzing, and presenting your data. All fully integrated. All yours for 30 days—free.

And now all this power is even easier to use. We've added convenient front-end menus that put you at the center of SAS System productivity in just seconds... whether you're a first-time user or a seasoned pro.

**Choices to Build On.** The modular design of the SAS System lets you tailor your software for individual, departmental, or company-wide computing needs. Start with essential data management and reporting tools. Then expand your range of applications with solid statistics, attention-getting graphics, reliable forecasts, and more. You can even

customize these applications—or design your own—using the SAS System's built-in applications development tools.

**Choices to Rely On.** With every SAS System application, you can receive expert technical support, documentation, training, and consulting services. More great reasons to choose the SAS System.

In fact, there are *hundreds* of reasons why more than a million software users—in thousands of organizations—have made the SAS System their #1 choice. Now it's your turn.

For a free 12-page SAS System executive summary, just give us a call at (919) 467-8000. We'll also tell you how you can receive SAS software for a free 30-day evaluation. In Canada, call (416) 443-9611.

## The SAS® System. More Choices for More Applications than Any Other Software.

## Boeing joins integrated network ranks

BY ELISABETH HORWITT  
CW STAFF

**SEATTLE** — Boeing Computer Services last week outlined its intentions to join the integrated network management fray by the middle of next year with multivendor network management software.

A key means by which Boeing hopes to differentiate its product is "linking network management applications to the business process, closing the gap between business strategy and the network that supports it," accord-

ing to Boeing group manager Christopher Statt.

For example, the system will be able to determine what kind of business communication or user will be affected by the failure of a particular line or device so that managers can prioritize resources for fixing the problem,

according to Statt.

Rather than trying to "provide a better Netview," Boeing will provide software to complement and integrate leading proprietary systems as well as those based on the Open Systems Interconnect (OSI) standard, Statt said.

Boeing developed a system for the National Aeronautics and Space Administration (NASA) that collects data from a variety of network management systems and displays key information at one console while storing less time-sensitive data in a common database, said Richard Helmick, division chief of systems engineering at NASA's Marshall Space Center.

Boeing's planned support of OSI is crucial to NASA, which is "trying to posture our network to support OSI routing as soon as we can," Helmick said.

Boeing plans to introduce a series of software modules to manage faults, performance, configuration, user administration, inventory, service-order processing and financial areas of networking, the vendor said.

## Burger King cooks up new system deals

BY ALAN J. RYAN  
CW STAFF

**MIAMI** — Burger King Corp. is moving forward in its multi-million-dollar implementation of point-of-sale (POS) systems and back-room computers in its 800 company-owned restaurants.

In separate agreements, Burger King has signed pacts with IBM and NCR Corp. to provide systems for the restaurants. Each vendor will supply systems for approximately 400 stores, with an average price tag of \$25,000 per store, a Burger King spokesman said.

Burger King's 5,000 franchisees will be able to purchase the systems from either IBM or NCR at volume-discount prices.

The POS systems were designed to keep managers informed about their restaurant operations, providing sales data and administrative information.

Plans for the \$20 million revamping were put in place by Bob Forte, former vice-president of MIS at Burger King, who recently left the company (CW, April 10). The new systems will replace the current one, which uses microphone, coded-receipt and voice communication from the order-entry counter to the kitchen.

Operators will enter the customer's order into a workstation. The order is then transmitted to a crew member in the kitchen, who will view it on display terminals using simple words rather than a coded description, said Daniel F. Barratti, director of operations development at Burger King.

The IBM POS terminals are based on the firm's Personal System/2 Model 30, as are the back-room computers for managers. The NCR machines are NCR 2760 POS terminals and NCR PC 3392s for the managers.

## HP loses wind in second-quarter sails

BY J. A. SAVAGE  
CP STAFF

PALO ALTO, Calif. — Unable to keep up with product orders for its workstations, personal computers and HP 3000 reduced instruction set computers, Hewlett-Packard Co. last week re-

ported that second-quarter profits increased only \$1 million more than the same period a year earlier.

Computer products accounted for some of the poor earnings, but a significant reason for the poor performance was that medical products were promised but

not shipped in the last quarter, according to the firm.

Orders for workstations and PCs were stronger than HP expected and customers stretched out delivery schedules for minicomputers, HP said.

One analyst took a dim view

of the explanations for the negli-

gible increase in profits to \$201 million. "The firm fell short by \$49 million. Even if it was able to deliver the PCs and workstations and more HP 3000s, it wouldn't have that much effect on the bottom line," said Adam Cuhney, an analyst at Kidder Peabody & Co. in San Francisco.

More shipments would not have offset deep discounts in the HP 3000 Model 950, Cuhney

said. In December, HP announced price hikes on the mini-computer, but customers who ordered them prior to the end of January received a rebate. However, many customers who did order opted not to take delivery until July, so the company has yet to make revenue from them, according to a spokeswoman.

Analysts such as Ed Bierlein, manager at San Francisco-based Harrison & Quist, Inc. anticipated profits in the computer side of the firm over the long term.

Discounts to dealerships contributed to the low earnings, the company said. HP is selling more computers through dealers, and thus, the percentage of lost revenue because of discounts is growing. An HP spokeswoman said that the firm plans to continue those discounts.

Expenses grew by 17%, largely because of the addition of 2,000 employees, while revenue grew by 15% to \$2.8 billion. With the acquisition of workstation maker Apollo Computer, Inc. this quarter, HP will add another 4,600 employees.

## IBM plans PS/2 plant in China

BY DAVE NORBLE  
EDG NEWS SERVICE

HONG KONG — As part of a thrust to boost its presence in China, IBM is negotiating a deal that could see its Personal System/2 personal computers being manufactured in China.

Although unwilling to discuss details of the deal, IBM China/Hong Kong Managing Director Bob Savage confirmed earlier this month that negotiations were under way and said an agreement was expected to be in place before the end of the year.

It is proposed that IBM will enter into a joint venture, the exact nature of which is unknown, with a Chinese firm to assemble various models of the PS/2 family. The systems would have Chinese-language capability and would be marketed only in China, Savage said. There are no plans for export at this stage.

While IBM enjoys a reasonable market share in China, with more than 200 of its 370 architecture systems installed there, the industry plans to expand its operations "as and when we believe it is profitable to do so," Savage said.

The company already has three third-party service centers that install and maintain equipment in China, the largest operated nationally by Brightstar, a subsidiary of the State Economic Information Center.

## With Masterpiece 2.0 There's Only One Other Piece Of Financial Software You'll Ever Need.

The promise of financial accounting software is realized at last. The Masterpiece® 2.0 Series is 21st century financial management for the entire corporation. From the data processing room to the executive suite.

It's comprehensive. It's fast. It integrates all your data and puts it into the most accommodating environment you'd ever work in.

For those at the top, Masterpiece 2.0 provides information with a touch of accuracy. Decision-making becomes easier. Data is disseminated company wide at your command. Profit forecasts are at your disposal quickly and easily. You've got state-of-the-art graphics to help present your case. And more importantly, you suddenly have the powerful sensation of knowing where you stand at any given moment.

Masterpiece 2.0 is not business as usual, but business as it is about to become. For IBM Mainframe, Midrange and Digital VAX environments, it's the financial software of the future.

Call or write Chris Andrews at 800-841-3734 (in Calif., 800-468-0725) and ask for either the "Masterpiece Executive" or "Masterpiece Technical" Overview. Find out what 21st century financial software can do for you.

# University scientists crack high-tech welfare data shell

**Editor's note:** This is one in a series of profiles of nominees for the Computer-world Smithsonian Awards, recognizing individuals and organizations that have achieved outstanding progress for society through the use of information technology. The awards will be presented in a ceremony held June 20 in New York.

BY SHARON BAKER  
OF STAFF

Since 1983, data that could show connections such as those between marriage rates and welfare and other government-funded programs sat largely untouched in a computer at the U.S. Bureau of the Census. Although most researchers knew the information existed, they had no way to access or analyze it.

All that started to change when two scientists at the University of Wisconsin in Madison developed a prototype four years ago to improve storage, access and retrieval of that data, part of a study called SIPP.

SIPP, which stands for Survey of Income and Program Participation, is a quarterly survey conducted by the Cen-

sus Bureau that monitors the short-term economic changes of respondents. Its primary purpose is to determine how people move on and off welfare and what can be done to make government-funded programs more efficient.

"There was a growing recognition that there was a lot of data there collected, but there was no control," said Alice Robbin, one of the prototype's developers. "The anticipated data processing systems of the federal government are extraordinarily serious. This issue of inaccessible data was becoming visible to everybody."

Robbin, an associate scientist at the university's Institute for Research on Poverty, and her partner, Martin David, knew that current technology could ease access to large-scale data sets such as SIPP. With the help of \$1.17 million in grants — \$677,000 of which was applied to direct costs — from the National Science Foundation and the Stone Foundation, they connected a variety of technologies into one prototype, known as SIPP Access.

The pair specifically selected SIPP for the project because of its massive nature. The 1984 study alone contains nearly seven million units of analysis and about 20,000 data elements that include detailed information about a respondent's

Robbin makes census data manageable

employment, education, health status, fertility, household composition and any employment and government program participation. That information is then stored on more than 30 tapes, totaling about 2.3G bytes of data in nine separate hierarchical files, Robbin said. An additional 300M bytes are entered into the statistical database every four months.

To make that information more manageable, Robbin and David first restructured the collected data into a relational database management system using Digital Equipment Corp.'s VAX and micro-computer versions of Relational Technology Inc.'s Ingres and Oracle Corp.'s Oracle.

"Once you think through how to organize the data, the retrieval is extremely rapid," Robbin said. "That's the essence of the power of this technology."

Using relational theory, the storage requirements for the data elements were reduced by 75% — from 2.3G bytes to 500M bytes — without loss of information, Robbin said. The original 30,000 elements were restructured into 8,000, and many cross-sectional variables were regrouped into tables.

The RDBMS reduces the time required to develop and complete research

using SIPP data. But that is only one part of the prototype. Three networks help bring the database to its users, which include researchers, analysts, government officials, faculty members and students. Ethernet connects campus computers with the university's Physical Sciences Laboratory, while the mainframe RDBMS is located at while Bitnet and Mosaic allow users to transfer files from the mainframe to their home computers.

In addition, the use of an optical archive storage disk eliminates the high cost of storing such massive amounts of data on magnetic disk. "Linking all of these technologies is what makes SIPP Access so powerful," Robbin stressed.

## Small version

The pair also developed a personal computer test database that contains a 2% random sample of SIPP and its data elements. The smaller database eliminates the cost of using the complete study to determine if it contains the data a researcher needs.

The PC database was beta-tested in August 1988 at six sites, including Cornell University and the Research Triangle Institute in North Carolina.

Since SIPP is a public survey and SIPP Access is funded with public grants, the prototype is available to anyone. To get into the database, all a user needs is a purchase order to the University of Wisconsin's computer center for computer time.

Robbin said that 150 people from across the country have been trained through workshops to use SIPP Access. Thirty people have actually conducted research and generated results with the help of the prototype.

Robbin and David's work on SIPP Access is slated to end in September, when funding runs out, but both hope that does not mean the demise of the prototype. Earlier this year, they met with Census Bureau officials and suggested that the technology be transferred to the bureau. Robbin hopes to have an answer from the bureau by the end of next month.

"It's clear that the RDBMS needs to be installed very early in the data design and collection stages," Robbin said. "That would really increase efficiency and improve productivity."

## Time savings

SIPP Access is making the lives of researchers and analysts, who rely on complex government surveys, a little easier.

Harlene Goggin, research demographer at the Research Triangle Institute, said she used to spend two to three years just organizing available data to conduct her research. With SIPP Access, she has cut that time down to fit months. "It's not just calendar time that's being saved," she emphasized. "It's computer costs and the costs for the person who was doing the programming. We're talking about an entirely different mechanism for going after the data."

SIPP Access is of particular importance to government officials, who need statistics quickly to back up various reports or speeches. "Most questions that are being asked of legislative assistants and research arms of the government are large questions of public policy," said Alice Robbin, who helped design the prototype. "They are now spending six months to two years trying to organize data in files that can be analyzed [with the RDBMS] in a couple of hours to a few days."

# Get a handle on power.

Introducing a new PS/2 with Micro Channel and 386 power.

Now you can take the uncompromising power of a full-function 386™ Personal System/2® with you wherever you go. It's the new IBM PS/2® Model P70 386 with Micro Channel.™ It lets you work in your client's office, your home or hotel room as effectively as you do in your own office.

The Model P70 386 clocks in at 20 MHz, so it's the perfect system for salespeople, engineers, insurance agents, accountants and power users who need to run DOS and OS/2™ applications at high speed. Add to that its state-of-the-art plasma display and an optional Hartmann® carrying case, and you start to see how the Model P70 386 is really a powerful PS/2 that happens to be portable.

Other features include either a 60Mb or a 120Mb fixed disk (so you can take all your data with you), a full-size keyboard (so it's easy to use) and an optional internal modem (so you're always in touch). And like all high-end PS/2s, the

Model P70 386 has Micro Channel to take full advantage of the 386 processor.

To find out more about how the portable power of the PS/2 Model P70 386 with Micro Channel can help you and your business, contact your IBM Authorized Dealer or your IBM marketing representative. To find the dealer nearest you call 1-800-IBM-2468, ext. 135.

Hartmann is a registered trademark of Hartmann-Lugger Company. IBM Personal System/2 and PS/2 are registered trademarks and OS/2 and Micro Channel are trademarks of IBM Corporation. 386 is a trademark of Intel Corp. 1988

## EDITORIAL

## Super quandary

**S**URVEYING THE NEWS of the past month, you could easily conclude that the U.S. supercomputer market is a mess. But you would first have to determine whether there is any real market left at all.

Last month Control Data decided that the R&D costs of ETA Systems, its supercomputer division, were too much for the cash-hungry parent to bear, so it folded that spin-off and left a domestic supercomputer field of one — market leader Cray Research, which logged three of every four supercomputer sales worldwide.

Last week it was Cray's turn to rattle the windows with a sonic boom of its own. The company announced it will spin off development of its sophisticated, experimental Cray-3 machine into a new and separate firm, to be headed by industry pioneer Seymour Cray.

The reason? The R&D costs of the Cray-3, which was to be the stalwart in the company's defense against an ardent effort by three Japanese companies to crack the supercomputer market, were sapping valuable resources. The parent said it would provide the new Cray Computer Co. with up to \$150 million in assets and cash to get set up. You get the feeling that Capt. Bligh had a better chance when he showed away the *Bounty* in the middle of the South Pacific in a 14-ft. dingy.

Certainly Cray Research acted in the fiduciary interests of its shareholders in jettisoning the Cray-3 to focus on more commercially viable projects. But what made these projects extraordinary, or so we are told, is that they are in the realm of "strategic" product efforts — products that make a vital contribution to our national defense, among other things. Supercomputers are the foundation for some of the Defense Department's most sophisticated weapons.

So while the pursuit of these projects may have been all well and good for the government and for contributing to the defense effort, they weren't contributing to the bottom line for CDC and Cray Research. On the contrary.

Now with CDC out of the supercomputer business and with Cray relegating its most advanced supercomputer efforts to the status of a spin-off, several questions are raised. Just how strategic is the supercomputer market to U.S. interests? If it is strategic, what are the implications of a single domestic supplier? And, perhaps most critically, why is it that Japan's Hitachi, Fujitsu and NEC corporations are plowing ahead with their supercomputer development efforts at a time when the U.S. market is crumbling?

If there's one thing U.S. companies have learned in the past 20 years, it is that once they forfeit leadership in a particular market they don't get it back. What is needed is a comprehensive investigation into just how vital a viable domestic supercomputer market is to the nation.

If the determination is that the market is indeed strategic, federal government will have to make supercomputer R&D a lot more attractive than it is today — or be content with reliance on foreign suppliers tomorrow.

## LETTERS TO THE EDITOR

## On the run again: In Depth reviewed

## Inopportune-ity

The "Running in crisis mode?" article [CW, April 17] begins with a claim that MIS has been too reliant on products — computer-aided software engineering (CASE), fourth-generation languages, etc. — to solve its problems. The article goes on to state that more attention to the people side of IS will bring the industry back on track.

Unfortunately, he ignores the third "P" — process. Inaccurate and incomplete planning is one of the major causes of poor case collection and IS misfortune in general. Software developers consistently make planning errors that other project-oriented industries such as aerospace and construction would not tolerate.

- Work plans do not include time for meetings or meeting preparation.
- Review cycles lack time for incorporating review comments into the product.
- Planned productivity levels (useful hours per day) are consistently unsustainable.

- Level-of-effort estimates are consistently based on best-case assumptions.

- Junior staff members are assigned to plan for senior staff without any adjustment to costs or schedules.

- Schedules do not take into consideration the fact that resource constraints typically place 100% of the activity on the critical path.
- Status reporting techniques are normally subjective (percent complete) rather than objective (earned value).

The fact is that the relationship among product, people and process is multiplicative — you have to do all three well. We need CASE. We need better people management. But we also need accurate plans, schedules and estimates. If we do not invest equally in process improvements, we will have happier programmers developing the wrong systems faster.

William R. Duncan  
President  
Duncan Associates  
Lexington, Mass.

"An irresistible opportune-ity" [CW, April 17] is hardly newsworthy. A vast market of computer-driven music software currently exists, with an installed base in the tens of thousands. The fact that some MIT researchers had spare computers lying around, which they decided to use for music applications, is of little interest in itself.

A variety of off-the-shelf music programs are available, with varying degrees of sophistication in algorithms, composition. One could not tell from the article precisely what MIT's software was intended for, let alone determine its significance. If MIT had developed another scoring or sequencing program, it is of little more significance than if it had developed another word processor.

For some professionals, it has been a stimulating journey that has thrust them into the senior ranks as strategic managers. For others, it has been a frightening trip that has forced them to give up their tecknocratic jargon in favor of a more civilized and accessible dialect.

But we still have a long way to go. As your article points out, we are at the point where we must focus more and more on our most important resource: our people.

The solution to the productivity problems seen in IS departments (for that matter, in the entire U.S.) is not in the latest technological tools. We will find the solution when we discover how to become partners with the business and also with our staff. Only then will we have created the kind of environment in which there is no substitute for excellence.

Dennis L. Duffy  
Senior Vice-President  
Director of MIS  
Burson-Marsteller  
New York

"An irresistible opportune-ity" [CW, April 17] is hardly newsworthy. A vast market of computer-driven music software currently exists, with an installed base in the tens of thousands. The fact that some MIT researchers had spare computers lying around, which they decided to use for music applications, is of little interest in itself.

A variety of off-the-shelf music programs are available, with varying degrees of sophistication in algorithms, composition. One could not tell from the article precisely what MIT's software was intended for, let alone determine its significance. If MIT had developed another scoring or sequencing program, it is of little more significance than if it had developed another word processor.

Granted that the bulk of your readers have little knowledge of the current crop of music programs, but a more comprehensive explanation of the software's function might have shed more light on what I believe the article was trying to accomplish.

While it is heartening to see stories about music software in your pages, I believe that your readers would be better served by focusing on people who are writing truly significant software in this area.

# How merger types affect users

DALE KUTNICK

**As a result of three years of consolidation in the computer and data communications industry, lawyers, investment bankers, merger and acquisition specialists, golden-parachuted executives and a handful of savvy stockholders have made millions by playing the high-tech takeover sweepstakes.**

Moreover, it appears that information systems industry merger and acquisition activity will continue for at least the next two to three years.

While some of the future merger and acquisition combinations will resemble "murders and acquiescence"—as is the recent Prime and MAI fiasco—most will take a more positive form, as has the proposed Apollo-Hewlett-Packard deal.

The acquirors will increasingly be large foreign or multinational concerns such as Hitachi, Fujitsu, Siemens or Olivetti. These mergers will often, for political and marketing reasons, be accomplished in concert with large U.S. partners—as was the case with the recent Hitachi/Electronic Data Systems acquisition of National Advanced Systems from National Semiconductor.

A depressed dollar and depressed stock prices make U.S. high-tech companies with any reasonable installed base attractive candidates.

A key question is: what happens to the acquirees' existing

user base? Will the "new" company support proprietary hardware and software? At what level and for how long?

#### Purges inevitable

Some housecleaning of middle- and upper management as well as administrative and support staff will occur. Depending on the financial condition of the parent company and the requirements to consolidate operations, this reduction could take six to 18 months. Too often, it is customer support and new development that suffers in these purges.

The level and length of ongoing support is almost directly linked to the purpose of the acquisition, be it financial consolidation, strategic technology capture, strategic market position or installed-base acquisition.

In practice, there are usually various combinations of these four motivations.

Strategic technology capture is the most benign of merger and acquisition activities and in fact usually benefits the user base. A stronger, better-financed suitor pushes forward a technology it requires—for example, Apple's acquisition of Network Innovations and Orion, and Unisys' takeover of Timeplex and Convergent Technologies. Many of these types of acquisitions should occur in the early 1990s in the PC software arena.

Strategic market positioning and installed base acquisition have mixed results for users depending on the financial health and strategy of the suitor. In the case of HP's pending Apollo acquisition, technical workstation market positioning as well as installed base capture were clearly the driving forces—although

the financials were also attractive. Apollo's 68,000 and Unix-based users will benefit from HP's superior support and growth paths; Apollo Domain users will be given multiple "co-

CA's "software supermarket" approach often leaves users on the short end of support. Aging products are left to wither and collect maintenance revenue. While difficult for users to digest, CA's approach will serve as a model for software companies in the 1990s.

Clearly, the most dangerous

sometime acquires Control Data in the near future.

The primary asset in these situations is an installed base—usually based on proprietary technology—that generates service and maintenance revenue greater than 40% of total revenue. This ensured cash flow gives the suitor tremendous financial leverage, and with appropriate cost-cutting, it can guarantee a three- to five-year payback on the initial investment.

Another extremely valuable asset is real estate, which is often leveraged on "consolidation" books. Again, certain operations and selling off properties can yield substantial short-term profits, especially in hot real estate markets such as Silicon Valley.

In acquisitions in which the primary purpose is financial consolidation, milking the installed base will begin almost immediately. Support and maintenance prices will generally rise, while service levels ebb. Support for proprietary hardware and software, especially new research and development, will be drastically curtailed.

In situations like these, it is often too late for users to run for cover without incurring significant expense. This is why future vendor selection will require closer inspection of a providers' financial condition. A growing percentage of revenue from maintenance and service should raise danger signals.

The IS industry will continue to be a dynamic one, but many 10- to 20-year-old companies have grown too complacent to keep pace. Acquisition activity will increase during the next two to three years, and a lot of it will be for financial consolidation. IS management must become more sensitive to the financial underpinnings of its vendors and of the industry in general.

MICHAEL MCLAUGHLIN

version slots" to ease Unix migration of acquisition from the perspective of the user is one calling for financial consolidation. In this case, the suitor believes that the user's base value is greater than the whole. This was certainly the case with Ashton Edelman's acquisition of Discopoint and MDS a few years back. It will undoubtedly be the case when

On the other hand, while Computer Associates' acquisition of Applied Data Research last year was motivated by installed base capture and tactical market positioning, financial consolidation was an even greater incentive.

Assessments of our milestone tracking, productivity data and projected buffer consumption indicate that we must continue to focus on the critical-path task requirements.

That request is not germane to the original scope of the project, but I hope no one gets too upset about this. What's the worst that could happen? Nobody pays attention to us anyway.

CÖMPUTERWORLD

mended seemed practical at the time and was later reviewed and agreed to by user management.

Translation: *It's half our fault.*

We made significant errors during the needs requirements phase based on our interviews with the users' clerks and super-visors.

Translation: *It's all their fault.*

The documentation considers similar examples and applicable error codes but contains no specific references to our perceived ignorance.

Translation: *We can't figure out the manual.*

That system has always been so reliable, I'm quite surprised it would blow up in the middle of the night. I'm glad you called me; there must be a really simple solution.

Translation: *Fix it yourself.*

MICHAEL B. COHN

Users and clients have started to figure out what's going on. They've been buying personal computers.

Reading manuals. Even putting paper into printers all by themselves. Some of them are finally starting to figure out a little bit about data processing.

Fortunately, we in MIS are still able to keep them off balance. We invent new abbreviations

Colin is a quality assurance representative based in Atlanta.

# ADABAS 5: more than more performance.

ADABAS 5's leading position as a high-performance DBMS has been verified once again by a series of standard, fully scaled benchmarks. Each was conducted on a National Advanced Systems AS/EX™ 100 (equivalent in power to an IBM 3090 500S). And audited by Coopers & Lybrand.

In the standardized TPI debit-credit benchmark, ADABAS 5 worked with a data base containing 1 million accounts. The results: a record-breaking 388 transactions per second (tps) - 99.3% serviced in under one second!

For the first time, an authentic ETI debit-credit benchmark was conducted with ADABAS 5 managing 10 million accounts. The results: 167 tps (from terminal in/to terminal out) - 99.5% serviced in under one second!

These figures represent major savings in time and money. But they're not surprising - at least not to the thousands of organizations which already use ADABAS 5.

They expect more performance. Plus the benefits that come from 18 years' experience in DBMS technology: - relational functionality which allows adaptable data structures and fast information retrieval based on multikey criteria - document management and free text retrieval - 24 hour processing in a fully integrated DB/DC environment - portable applications across various hardware and operating systems - distributed processing - entity relationship data bases with recursive retrieval functions for knowledge-based systems.

Discover how much more profitable your DP organization can be. Conduct your own ADABAS 5 benchmark, using your own data and application profile in your own production environment. The facts will speak for themselves.

Demand the performance and functionality only ADABAS 5 can offer.

SOFT  
TALK

Stanley Gibson

## CASE: Still more talk than action

Poor CASE. It's still not ready for prime time.

The recent CASE Expo in Washington, D.C., was full of advice about computer-aided software engineering (CASE) but was generally short on experience users had with it. For managers, however, the times were talkin' past. They want to get on with it.

"This is a show for vendors and consultants," was the appraisal — a stinging condemnation, really — offered by a user in attendance. To be precise, the attendee was only a prospective user of CASE. What he wanted to hear was the experience of someone who has actually tried CASE and could repeat the pluses and minuses of the experience. To his fair, he did attend one session that was led by a user, and he praised that one highly, but he longed for more.

There probably would have been more user-led seminars if the show's organizers could have found users to lead them. That it was not possible to do so means that CASE is still in its infancy. That may not be a surprise to everyone, but it is odd that a technology so widely acclaimed has not still really caught on.

While the CASE Expo was short on concrete user experiences.

## Sound of silence greets new IMS release

### ANALYSIS

BY STANLEY GIBSON  
CW STAFF

What IBM argued as proof of its intention to keep its 20-year-old database management system purring along under Enterprise Systems Architecture (ESA) has received a muted greeting from managers at large IMS shops.

IBM quietly announced IMS/ESA Version 3 Release 1 last October. This version features virtual storage constraint relief, a feature most needed by large users.

But the release is not for everyone — at least not now. "In January 1990, we'll go to IMS/ESA," said Jack Melton, director of systems development at Ryerson Train Rental Inc. in Miami. Before that, Melton said, he plans to move to IMS Version 2 Release 2 next month. In the third quarter, he plans to install

IMS/ESA on his IBM 3090 Model 400E. Melton said he does not suffer from virtual storage constraint.

Steve Atre at Atrc/Computer Associates in Rye, N.Y., agrees that 50% to 75% of IMS users may need it. "IMS customers have been using IMS for some time and may be pushing its limits," she said.

The release, which requires MVS/ESA and ESA-capable hardware, will not run on MVS/XA. It is not an upgrade from Release 2 Version 2, but it purchased separately and is priced 5% higher than its predecessor.

Release 3 Version 1 is currently being tried on an early-support basis and will undergo "managed availability," for those users with virtual storage constraints in October. General availability is scheduled for March 1990.

"We have looked at it but didn't see anything there that

### Added attractions

*IMS Version 3 Release 1 is intended to take advantage of the capabilities of IBM's ESA*

#### Features

- DI/1 virtual storage constraint relief
- Log compression
- Improved hyperspace
- Moves database control blocks and buffers above 16M-byte line
- Compresses logging data, allowing more efficient use of space
- Allows VSAM data set buffers to be separated from buffers of other data sets

BY CRAIG COOPER

MVS/ESA next month, saying that at 40,000 transactions per day, his is not the kind of high-transaction environment that benefits most from IMS/ESA.

A major change in the Release 3

## Product maintenance charges are boosted

BY JAMES DALY  
CW STAFF

IBM recently announced an increase in the monthly or annual maintenance charge of dozens of products, giving customers an escape route from Corporate Service Agreement (CSA) maintenance contracts.

The price hikes on a wide variety of products ranging from point-of-sale terminals to disk drives, become effective Sept. 1, although state and local governmental customers with fiscal years beginning June 1 will not

be affected by the increase until June 1, 1990. IBM officials said when asked about the low-profile announcement.

Although most of the minimum monthly maintenance charge increases range from 6% to 8%, some have increased more than 11%. This has the potential to let customers void existing CSA contracts, which have a per-machine price increase cap that grants the customer the right to withdraw without a penalty charge if a machine's maintenance price is increased by more than 7% annually.

All CSA agreements also carry a 3.5% price increase limit, wherein if the total contract cost is increased by more than 3.5% annually, the customer also has the right to withdraw from CSA without a penalty charge.

According to one maintenance consultant, IBM has not always treated these contracts as gospel. Last year, IBM exceeded the 7% per-machine upper limit on its 3080 family of mainframes, said Donald Goodspeed, vice-president of service and maintenance strategies at Metra Corp. Inc. in Westport, Conn. But few customers bothered withdrawing because of the amount of paperwork and effort involved in exercising this option, he said.

IBM often downplays these announcements. "IBM is not go-

ing to tell anybody that they just raised the price," said one IBM alumnus, "they leave it up to the customer to figure it out," said John McCormack, a senior marketing representative at Sentinel Computer Services, Inc., a third-party maintenance firm in Oak Brook, Ill.

Earlier this year, IBM announced a revamped maintenance arrangement. Under its Serviceplus, the total contract price increase limit will be raised to 5%, while the per-machine price limit will be eliminated.

## Spotlight

### Remote Printing at Low Cost!!!

**BIMSPPOOL** retrieves print output from the DOS/VSE POWER spooling queue and prints it on a local or remote 3270 terminal printer via CICS. This provides RJE printing without its expense and requirements. (Often the 3270 printers are already in place, and lightly used.)

CRT functions are provided to display queues, manage print tasks, and to view output listings instead of or prior to printing.

Hundreds of users worldwide, since 1979. IBM "wrote the book" on spooling to terminal printers from POWER queues.

Optional laser printer support feature available also.

Call for full documentation or free 30 day trial.

Price: \$4000, \$2000/yr, or \$200/mo. BIMSPPOOL is also included in several IBM product group offerings.

IBM has TS 15 system software products to improve productivity and use of DOS/VSE, OS, and OS/360, and also performs systems programming consulting. Marketing agents in most countries.

## Present How To Benefit From DB2 and SAA Today

### A One-Day DB2 and SAA Solutions Conference

DB2 and SAA can help you increase your company's efficiency by providing a powerful, integrated solution for managing financial, manufacturing, and distribution data.

The IBM corporation brings you the most complete DB2 and SAA Solutions conference — We've invited leading resource management experts to present them as business solutions for availability, and integrity of data and system solutions.

#### DB2 and SAA Solutions Conference Will

offer you the opportunity to learn directly from the experts about:

- Investing in DB2 and SAA
- Implementing DB2 and SAA
- Using DB2 and SAA to support current business needs
- Optimizing DB2 and SAA
- Expanding DB2 and SAA

Discover why DB2 and SAA are the best tools for manipulating and querying financial, manufacturing, and service databases.

Participate in live, direct demonstrations of DB2 financial and DB2 manufacturing.

Bring Your Team. Bring maximum results. Assemble your team from data processing, finance, and MVS resources and attend the DB2 and SAA Solutions Conference together.

#### Conference Schedule

Date	City	Date
May 2	Washington, D.C.	June 12
May 9	Baltimore	June 13
May 16	Boston	June 14
May 23	Atlanta	June 15
June 1	Dallas	June 16
June 6	Los Angeles	June 17
June 13	Seattle	June 18

#### Attend This Conference... No Cost... Register Today!

The DB2 and SAA Solutions Conference is offered at no cost. Register today for the DB2 and SAA Solutions Conference at (415) 947-2000. Or Write to: IBM Systems Division, DB2 and SAA Solutions Conference, 1000 Marquette Place, North, 305 East Market Street, San Francisco, CA 94107.

# Wang minis, PCs dock in Seattle

*Port authority to throw older Burroughs mainframe overboard for Wang*

## ON SITE

BY PATRICK WAURZYNIAK  
CW STAFF

SEATTLE — When the Port of Seattle decided to distribute its processing in 1980, it never looked back.

The port authority, which handles one million containers a year on the eastern side of Puget Sound and manages Seattle-Tacoma International Airport, plans to complete a migration from its decade-old Burroughs Corp. mainframe to a fleet of Wang Laboratories Inc. minicomputers and personal computers later this year.

During the past two years, the port's MIS group has been busily rewriting the last of its mainframe applications for use in the Wang environment and now has several Wang minicomputers.

The Port, which does most of its own software development,

also has about 280 IBM-compatible Wang PCs and 565 terminals connected to the midrange systems through Wang System Networking.

The Port's mainframe, a Burroughs B4890 bought second-hand six years ago for \$135,000, still holds three batch-process applications — accounts receivable, a work-in-progress schedule and payroll system for the Port's 1,175 employees.

One reason cited for distributed processing was that the Port's mainframe — rated at only 0.6 million instructions per second in a box that held only 1M byte of memory — was running out of steam.

"There are a lot of PCs out there with more memory," said Ted Hutton, who is the Port's systems manager and is responsible for running information systems computers and overseeing its technical support.

"Back in 1979, these systems weren't that old," Hutton said of

the mainframe. "We just saw the opportunity to save money on operations and to reduce our risks. We wouldn't have all our eggs in one basket in one computer room, and we saw the opportunity for greatly increased productivity."

Another consideration for distributed processing was the Wang equipment itself, which Hutton described as "a much more user-friendly development machine than the mainframe." With Wang, the port authority developed many specialized transportation packages in-house such as tracking cargo movement, warehousing functions and generating electronic forms for U.S. Customs shipments.

"We're a Wang shop, and we're pretty much locked in," said Cecil Patterson, Port of Seattle director of information systems, who noted that the authority's own business is distributed. "We anticipate pushing that

[B4890] out the door by the end of 1990."

"The reason we went to minis is we were out of computing power," Patterson said. "We either had to replace the old mainframes or go distributed. We decided to go distributed."

Patterson noted that minis

agency operated two Burroughs — now Unisys Corp. — mainframes, the B4890 and an older, smaller Burroughs B3800, even as the port began buying the Wang minis in 1980, usually one or two per year.

At one time, the port had 30 Burroughs applications. But now, the 125-plus applications predominantly run on Wang minis — two VS 7310s, two VS 300s, two VS 100s, a VS 85 and a VS 6E — with a Wang VS 5000 on the way.

Meanwhile, most port applications have been redesigned for new business applications and to take advantage of the Wang equipment. Hutton, a 13-year Port employee, said the Port now "is riding the old applications out until they're converted over to the new ones."

Rather than depend on Wang for support, the Port trained its own technical support staff. The Port's applications are written internally in Cobol, except for a few accounting packages such as general ledger, accounts payable and fixed assets purchased from Computeron, and a system for purchase orders from Structured

*Continued on page 27*

Patterson says the Port is committed to Wang

cost much less than a centralized processor. "We could buy minis as the need arose rather than spending millions for a mainframe."

Until four years ago, the

## Suit wearing thin around users' pockets

BY JAMES DALY  
CW STAFF

ATLANTA — Digital Equipment Corp.'s recently filed patent-infringement suit against drive maker Systems Industries, Inc. (SI) has left an unpleasant taste in the mouths of many users, who fear it may be indicative of a game plan to clamp down on the often less expensive products of third-party vendors.

Interviews with attendees at the Dexpo South '89 and Decus shows earlier this month revealed that many feel that the ultimate loser in the legal imbroglio

will be the customer.

"DEC parts usually cost more than those of third-party vendors, and if they are successful in locking those vendors out, it's going to drive our costs up," said Bill Thomas, owner of Central Datacon, a communications equipment supplier based in Huntsville, Ala.

DEC officials, however, claimed the reasons they charged SI with infringement of four Standard Disk Interface (SDI) hard technology patents are much broader. According to a statement issued by the company, "The action taken by Digital

demonstrates the company's long-standing policy and commitment to protect vigorously its innovations resulting from investments in research and development."

The suit is directed against SI's C-series drives — which are reverse-engineered models of DEC's SDI connection — and seeks an injunction against sales and an award for triple damages.

Some customers said they feel DEC's move is counterproductive. "It's a bad approach. DEC can afford to do more litigation with their patents if indeed we're going to encourage innovation in the industry," said Glenn Greenwald, an engineer at General Electric Co. in Atlanta.

SI spokesman Brian Edwards said DEC's action is like throwing a pebble in a pond to see how far the ripples go.

DEC may already be achieving its desired result. One Detroit-based user who wished to remain anonymous said DEC's actions against SI "strengthen our position to stick with DEC materials."

Several converging factors may have been the impetus to start DEC's legal mind wandering. The firm's financial results have been lackluster of late, while Edwards said that disk-drive prices have dropped 40%

in the past year.

Still, actions against third-party vendors are not new to DEC. In 1980, DEC sued SI over a patent infringement in relation to its Syncrhonized Backplane Interconnect. That suit was settled in 1987, when DEC issued licenses to SI specifications to manufacture disk and tape drives using the SBI technology. DEC settled a similar action against Remex Corp. last year.

But because most third-party companies ran out of cash long before the courts get around to a decision, no suit by DEC has ever been decided in court, thus leaving the legitimacy of DEC's claims up in the air.

For IBM 3270, S 36 38, and AS 400 Users:

## 100% IBM 4224 Compatible!

### Available Now!

With our plug-compatible IS 7224 desktop dot matrix printers, you can print everything an IBM 4224 can print...and more.

We offer 208 cps monochrome and 402 cps monochrome. Each prints high-resolution graphics, bar codes, and extensive characters with full IPDS support...now!

Even better, our IS 7224 printers cost much less than their IBM counterparts.

For more information, call 1-800-544-4872  
(in Michigan, 313/599-5900)

► Our IS 7224-401 is a compact, economical 208 cps model.

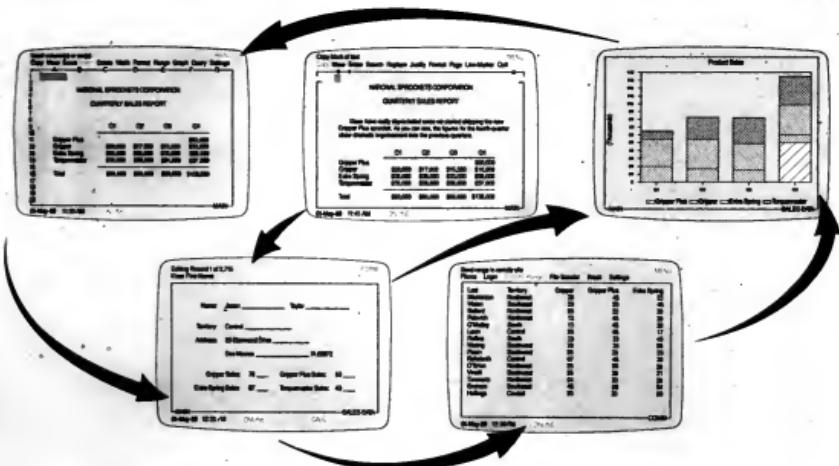

► Our high-speed IS 7224-302 prints 402 cps in up to eight colors.

# The #1 software for people who like to be in five places at once.

Now when you buy the world's leading integrated software package you get more than the ability to seamlessly link five applications at once. You can also get Allways, the Spreadsheet Publisher from Funk Software, all at one great price.\* So you can create terrific-looking reports.

Why is Lotus® Symphony® so popular? First, because it's the only integrated package to link applications with a single, unified data model. Which means all application work—numerical, textual, and graphical—is based on the same data source. So, your users never have to cut and paste information or type in a formula to create a link, as in other integrated programs.

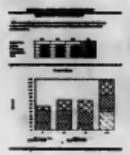

Second, Symphony's macros and sophisticated command language let you develop custom, turn-key applications for your users. In less time

than if you'd developed equivalent applications with a high-level programming language. That way, your users don't have to know how the program works, only how to perform the applications you've developed.

Third, the Symphony spreadsheet is based on Lotus 1-2-3®, the industry standard. As 1-2-3 advances, Symphony will incorporate the latest spreadsheet features, in addition to enhancements to the other Symphony applications.

And with the Allways add-in, your Symphony reports will look better than ever. Allways gives you a wide range of formatting and printing options, including laser printer support. Allways is easy to use, and works directly from within Symphony.

To take advantage of this offer, call your Lotus Authorized Reseller today. And get your users working in a few new directions.

Using the Allways program, your Symphony documents will always look terrific.

## Lotus Symphony now with Allways

## IPL carves slice off card costs

BY ROSEMARY HAMILTON  
CW STAFF

IPL Systems, Inc., slashed prices nearly in half last week on some of its memory upgrades for the IBM 4381 mainframes.

The price cut makes the new IPL memory cards more competitive with used IBM 4381 memory, according to William O'Neill, director of mainframe sales at IPL.

"In many cases, when customers have the choice, they will go with IBM used memory rather than with another manufacturer's new memory," O'Neill said.

Four 2M-byte cards, which had sold for \$24,500, will now sell for \$13,600. A 16M-byte upgrade, offered as four 4M-byte cards, will now sell for \$25,600 instead of \$44,500. The memory upgrades are used with 4381 mainframes in Groups 1 through 14.

According to O'Neill, users could pick up four 2M-byte cards for about \$12,500 on the used market.

The IPL memory upgrades come with a lifetime warranty. In addition, they offer a faster write cycle than IBM's 4381 memory, O'Neill said. The IPL memory takes 11 cycles to perform a write instruction while the IBM memory takes approximately twice as long, O'Neill said.

The cuts are effective immediately.

## Seattle

CONTINUED FROM PAGE 25

tured Computing Systems.

Although its Cobol programs from the batch-oriented Burroughs mainframe are not portable to the on-line environment of the Wangs, the port has continued to write applications for Wang in Cobol.

One application is a Wang-based system in which the Port sends data to U.S. Customs for steamship lines to expedite clearance of cargo.

Another is a warehousing application to tie the Port into other customer systems via electronic data interchange technology to handle bills of lading and order selection sheets from other locations electronically.

Besides shifting to minis, another big project is a budding venture between the Port of Seattle and the Port of Tacoma under which the two agencies will cooperate on an automated cargo-tracking system called the Puget Sound Community Cargo Release System.

"We haven't done much before with them because they're a competitor," Patterson said of Port of Tacoma. "But our thrust is to make it easier for everyone to do business no matter whose docks those goods come through. There are obvious places to."

The Port of Seattle, which looked at similar systems in Rotterdam, The Netherlands and Felstow, England, also has checked out a project currently in place at the Port of New York-New Jersey. While the Puget Sound plan is already almost a year old, if eventually successful, the venture would link six coasting agencies in a messaging network with the area's steamship lines, truck and rail carriers and transportation brokers.

## Mips' memory prices fall

BY J. A. SAVAGE  
CW STAFF

SUNNYVALE, Calif. — Mips Computer Systems, Inc. announced recently it is reducing the cost of add-on memory by about 20% for its M/120 series and M/2000 series minicomputers, which run at 12 or 20 million instructions per second (MIPS), respectively.

Mips claims it is the first company to reduce prices as a result of the industry-wide decrease in dynamic random-access memory chip prices in the minicomputer and high-end workstation market. Hikes

in DRAM prices had been blamed for increases in system prices over a year ago.

An 8M-byte add-on for the M/120 dropped from \$7,350 to \$6,000, and a 32M-byte add-on for the M/2000 went from \$30,000 to \$25,000, according to Frank Madren, director of systems marketing for the company, which is located here.

All of Mips' computers are based on the firm's proprietary reduced instruction set computing technology and run Unix.

Mips also unveiled two devices to allow ease of use for its systems in the commercial arena.

The firm announced availability of a low-cost small computer systems interface (SCSI) disk drive for the M/2000 series.

With the lower performance SCSI drive, the entry-level price for an M/2000 is \$83,000 vs. a price of \$100,000 for an M/2000 with a more scientific or commercial orientation and a higher data transfer rate storage module drive, according to Madren.

To facilitate commercial applications needing daily backups, Mips is offering a 2G-byte 8mm cartridge tape storage system for the M/120 and the M/2000.

The Model 115 tape backup carries a list price of \$6,500. A 120M-byte tape drive for the M/2000 minicomputer is already available.

# A Strong CASE for Choosing Pilot Over Comshare.

**PILOT ANNOUNCES INDUSTRY FIRST**  
Advanced EIS Code Generators

BOSTON—Pilot Executive Software, Inc., pioneers of Executive Information Systems, recently introduced its

Innovation has made us a strong competitor. We developed the first commercial Executive Information System in 1984. We pioneered cooperative processing architectures, time-series relational databases, dynamic menuing and packaged EIS applications.

Now we're introducing our new line of EIS/C™ code generators that eliminate up to 80% of the development and support costs of an EIS—the first application of back-end CASE tools in the EIS industry.

This innovation lets you generate executive applications faster and with better code integrity than any system the competition can provide.

Leadership. There's an old New England saying: "The empty wagon rumbles the loudest."

Real leadership is not won by words or claims. It's built on references.

Real corporations using real systems.

Ask for our complete user list. Then ask Comshare for their list of "10,000 EIS users."

If you want to see more, sign up for one of our hands-on workshops. You'll be able to build your own CASE for choosing Pilot.

For more information, call (617) 350-7035. Or complete and mail the coupon below to: Pilot Executive Software, 40 Broad Street, Boston, MA 02109.

EXECUTIVE SOFTWARE

If You Keep  
An Open Mind,  
You Don't Stop  
With The Standards.

# You Begin.

There's a big difference between settling for standards and setting them. At NCR, we're open-minded about open systems architecture. That means the standard is the starting point; and the sky's the limit on how flexibly the technology can be applied and advanced.

With technology, we're so open-minded that our 25MHz 386 is faster than a 25MHz 386. How? We didn't settle for the standard 32KB of cache memory offered in many other PCs. Instead, we raised it to 64KB. This gives our new PC925™ faster response time and throughput. The result—increased productivity. And one more example of NCR

adding value to advance an industry standard to a new standard of excellence in performance.

Our open-mindedness opens unlimited opportunities for applying PC technology to a variety of business problems. Because no business considers its computer needs standard.

At NCR, we're open to finding the PC solution you have in mind for your business.

If you're open to this kind of thinking, call 1 800 544-3333 for a free literature packet and the location of the Authorized NCR Reseller or sales representative nearest you. Or write to us at P.O. Box 785, Dayton, Ohio 45482-9905.

ANDERSEN

## SOFT NOTES

# Index gets object capacity

**I**ndex Technology Corp. recently signed a licensing agreement with Ontologic, Inc., in Billerica, Mass., under which Index will gain access to Ontologic's object-oriented database technology for use in future products.

Richard Carpenter, president and chief executive officer of Index, a maker of computer-aided software engineering (CASE) products, said Ontologic's object-oriented technology will be "a natural fit" with Index's CASE tools.

**S**ystems Center, Inc. in Reston, Va., said its VMA Tape product now supports the Storage Technology 4400 Automated Cartridge System (ACS). The 4400 ACS is an automated cartridge-based library system.

VMA Tape provides volume selection,

tracking and management and automatic drive allocation. The 4400 ACS performs the tape mount and dismount functions normally performed by the data center operator.

**U**nisys Corp. said it signed a marketing agreement with Cargolux Airlines International SA in Luxembourg for the rights to the Champ cargo revenue accounting system. The Unisys version of Champ is called the Unisys Cargo Revenue Accounting system. Unisys is a suite of software designed to handle accounts receivable, accounts payable, proration, provisioning and revenue reporting of cargo accounting. Unisys also announced with EDI, Inc. in Gaithersburg, Md., that EDI's Telink software will be migrated to run under the Unix operating system.

## Gibson

CONTINUED FROM PAGE 23

ences, it was replete with noble platitudes from consultants and business school professors. We heard Ed Yourdon, publisher of *American Publisher Magazine*, tell those in attendance that most users were not ready for CASE. We heard other speakers say that if those same users had not moved to CASE, their competition would leave them in the dust.

CASE has been illiterate to set before, and the analogy is probably good for another round. If CASE is like a lion, then hearing moaists offer cautions and advice is only worth so much. Yet, the clichés about a long-term relationship and waiting until you are ready are valuable. But users crave experience from which their real lessons will be learned. They yearn to hear those "true-life stories."

What will probably happen for most users is they will lurch clumsily into CASE and get their act together only after some unpleasant experiences.

However, what is needed to get them to that point is a catalytic event. Such an event could be the appearance of the IBM repository. If it lives up to its billing, the repository should clear away several obstacles on the path of CASE. Most obvious, it is intended to provide a sorely-needed standard backbone into which CASE tools can "snap in and snap out," as IBM puts it.

Most users will tell you that they do not feel comfortable committing to the encyclopedia or repository of a relatively small vendor.

Their point of view is understandable.

The world's largest CASE vendors express their annual sales in the tens of millions of dollars. The companies that are in most urgent need of CASE have sales in the billions. Those giants do not feel comfortable with all of their data learning so heavily on one of these tiny software pillars.

Now if that pillar were IBM and its standard repository, that would be differ-

**I**F IT lives up to its billing, IBM's repository should clear away several obstacles in the path of CASE.

ent. There is no question that one of IBM's major reasons for existence is that it knows how to make people feel comfortable. Over the years, whatever else IBM has done, it has done that.

A \$10 million vendor claiming IBM compliance and boasting a recommendation from IBM will be far more successful than that same company today without IBM's blessing.

Beyond satisfying the crying need for a standard backbone for CASE, the repository cannot be expected to solve all problems. What it will probably do is launch users on the path to discovery, with all the blessings and curses that go with that. It will get them on their way to where they have already decided they must go.

Gibson is *Computerworld's* senior editor, software.

# IBM pops conversion aid cork

BY JEAN S. BOZMAN

CW STAFF

**I**BM recently announced a conversion aid for users of Computer Associates International, Inc.'s ACF II mainframe security system.

"It's designed to help customers through a complicated migration," an IBM spokesman said. "It's a set of programs that are used to convert the bulk of the ACF II database into the RACF database automatically."

IBM is also providing a program that will allow ACF III and IBM's own RACF systems to coexist while customers convert files to the new RACF system. Although IBM claimed to have the price of the conversion package, it includes three weeks of consulting from IBM engineers.

Michael Braude at Gartner Group, Inc., said he believes the move was a response to customer demand for a conversion tool.

## IBM release

CONTINUED FROM PAGE 23

3 Version 1 is that it is broken into two parts — IMS/ESA Database manager and IMS/ESA Transaction Manager. Although previous releases of IMS have been in two parts, both were required to work together. In Release 3 Version 1, however, the IMS/ESA Database Manager can work with different transaction managers.

Similarly, the IMS/ESA Transaction Manager, which IBM has and is compliant with Systems Application Architecture (SAA), works with other database management systems, including IBM's DB2.

George Coleman, an independent consultant in Chicago and formerly at Amdahl Corp., criticized the release because it requires the ESA architecture without any compelling reason. "The virtual storage constraint relief is the only thing that users want among the features added, but that could have been added without tying the new version to ESA. They could have added it to the XA version," Coleman said.

Michael P. McLoughlin, manager of the IMS technical office at IBM's Santa

"I suspect some users asked them for help in converting from ACF II to RACF, and they decided to make the programs available," Braude said.

CA and IBM have about 80% of the IBM mainframe sites that run MVS security systems, Braude estimated. He said IBM has about 4,500 sites worldwide to CA's 3,000, including those that run CA's other security product, Top Secret. Computer Associates and IBM have the capability to fight for market share, Braude said, but they may choose not to.

Ron Bailey, president of Vanguard Integrity Professionals, Inc. in Orange, Calif., said the product is not meant to crowd Computer Associates and other security-software vendors out of the market. "Security software from Computer Associates' file ACF II and Top Secret, will be able to coexist with RACF, as long as the vendor uses the standard interface IBM provides," he said.

Teresa Laboratory in San Jose, Calif., conceded that IBM could have added virtual storage constraint relief under MVS/KA but asserted that the other features in the release are desired by customers and are worth the price.

One enhancement in the release is Fastpath high-speed sequential processing, which uses the Fast Write capability of IBM 3990 Model 3 controllers. The enhancement can save time in logging and copying for backup, McLoughlin said but cannot say how much time the function saves because performance is still being measured in early support accounts.

Atre said the enhanced Fast Path will encourage IBM users with high-transaction volumes to migrate to it rather than use IBM's transaction processing facility, which typically requires large numbers of support personnel. "IBM is saying if you are going to stay with IMS, then move to IMS/ESA with Fast Path," Atre said.

Despite IBM's recently proclamation that IMS will carry on for many years, Atre said the release's low-key announcement was instead to draw attention from DB2, IBM's fully SAA-compliant relational DBMS. "IBM is not making a big deal out of IMS announcements because DB2 is strategic," Atre said.

# KEDIT 4.0

## XEDIT COMPATIBLE PC EDITOR

**KEDIT™** is a text editor for DOS and OS/2 that supports most commands often found in XEDIT, IBM's editor for VM/CMS. But KEDIT goes beyond XEDIT compatibility with special PC-based features for a first-rate combination of mainframe power and PC flexibility.

■ More than 100 XEDIT-compatible commands and SET options, including the ALL command.

■ XEDIT prefix commands, targets, and fullscreen layout.

■ Multiple files, multiple windows.

■ Built-in subset of the REXX macro language included.

■ Interfaces to Personal REXX, complete implementation of REXX.

■ Enhanced block operations.

■ And much, much more.

"While KEDIT remains true to its heritage in retaining compatibility with XEDIT and REXX, it is also one of the most feature-packed PC text editors around." — PC Magazine, 10/31/88

KEDIT Version 4.0 is available at \$150. OS/2 version is \$175. Add \$3 shipping. MC, VISA, American Express. Demo version available.

**MANSFIELD**  
SOFTWARE GROUP  
PO. Box 532, Stow, CT 06268

## NEW AT DEXPO SOUTH '89

The following products were announced at Dexpo South '89:

- **Systems Industries** in Milpitas, Calif., announced its C series family of Digital Equipment Corp.-distributed systems architecture-compatible disk drives with the introduction of an 8-in. 8632C drive.

The S1692C provides 10.3G bytes of formatted capacity per subsystem and connects directly to DEC VAX computers or VAX cluster configurations, according to the vendor. The products offer a 16 msec average access seek time and a reported transfer rate of 2.75M byte/sec.; it is scheduled for delivery in June.

A full 12-drive 10.5G-byte subsystem is priced at \$65,000.

- A file and directory management software program for VAX/VMS users was introduced by Hancock Software, Inc. in Watertown, Mass.

According to the company, Filemaster was designed to simplify routine file management tasks. The program simultaneously places all relevant data, including directory structure, file names, contents and attributes, on a DEC-supported ter-

minal screen in a multiwindow display format. Additional features reportedly include point-and-shoot menus, file selection and sorting commands.

Pricing ranges from \$495 to \$7,950, depending on CPU size.

- **Distributed Logic Corp.** unveiled its power-disk series Winchester storage subsystems, designed to provide DEC users with up to 673M bytes of formatted capacity per drive in a 5½-in. enhanced small disk interface configuration.

The units reportedly offer a 2.4M byte/sec. write rate and a 16 msec average seek time and are said to be available in tabletop, multidevice rack mount, tower enclosure and add-in slot-plate versions.

Pricing ranges from \$7,400 to \$28,690, depending on configuration. The company is headquartered in Anaheim, Calif.

- **Recital Corp.** released Version 5.5C of Recital, the company's relational database management system and fourth-generation language product.

The Danvers, Mass.-based vendor said that more than 43 functions have been added to the

software, including support for text search in memo fields, pull-down menus on DEC VT terminals and support for nested reads and data manipulation. The software is reported to be compatible with Ashton-Tate Corp.'s DBase III Plus, Nantucket Corp.'s Clipper and Fox Software, Inc.'s Foxbase Plus personal computer-based packages.

Recital runs on VAX/VMS and AT&T Unix-based systems.

Pricing ranges from \$4,500 to \$45,000.

- **Control Data Corp.** introduced an environmental monitoring component for its Project Program of Service Enhancements for VAX/VMS system managers, according to the vendor.

Project 3000, the latest addition to the Project Program, reportedly provides software and sensors that monitor environmental conditions within a computer room, including temperature, humidity, floor water and smoke.

Pricing begins at \$100 per site per month and excludes sensor hardware, which must be purchased separately.

- The Minnesota-based company also announced several software enhancements for its Project 1000- and 2000-level

services, such as disk utilization and process and security monitoring capabilities, the vendor said.

Pricing ranges from 5% to 15% of monthly hardware maintenance costs, according to the vendor.

- **Emulex Corp.**, in Costa Mesa, Calif., announced the QD35-III SMD-E disk controller with 1M byte of cache memory, developed specifically for DEC Microvax 3500, 3600, 3800 and 3900 computers.

The controller reportedly provides rotation position detection and zero latency read in addition to cache memory and is especially suited for imaging and graphics applications, the company said.

Pricing begins at \$2,995, and initial customer shipments are scheduled for June.

- **Data Retrieval Corp.** introduced its Textbook Online Manual software, a VAX/VMS application that reportedly uses a free-form, full-text database to manage large amounts of reference information and images online.

The program was designed to allow users to store, update, search and retrieve information normally found in book or paper

format, the company said. This includes safety procedure manuals, plant maintenance documentation, pricing catalogs and engineering diagrams. The software also runs on IBM MVS/CICS systems.

Pricing begins at \$9,300 for nongraphics applications; applications with graphics capabilities are priced from \$14,925. The company is headquartered in Milwaukee.

- **Clearysoft Research Corp.** in Hopkinton, Mass., announced a series of disk controllers and disk storage subsystems for the VAX 6000 series.

The DSII disk controller resides directly on the VAXBI I/O bus and incorporates a Motorola, Inc. 68020 microprocessor and 64K bytes of buffering, the company said. The product reportedly offers a peak transfer rate of 4M byte/sec., allows up to seven disk devices and occupies only one slot.

The subsystem is available in several versions, ranging from standard 19-in. rack-mountable units to fully configured cabinets, the vendor said.

Pricing begins at \$22,500 for a single-unit, one-controller, one-drive configuration to \$114,500 for the maximum one-controller, seven-drive version.

## ELIMINATE YOUR COMPETITION

Most organizations needlessly compete against themselves. They can't develop solutions to their own business needs, because they can't integrate their own corporate data. Demand the distributed processing advantages of ADABAS 5. And beat the real competition.

For a free copy of an updated benchmark report on ADABAS 5 performance, call toll-free: 1-800-343-5134. ADABAS is a registered trademark of Software AG. © 1989 Software AG.

## 33% RETURN ON INVESTMENT!

With the optimum DB/DC integration technology of ADABAS 5, you can increase your computer's CPU performance by as much as 33%. And that not only makes sense—it makes dollars.

For a free copy of an updated benchmark report on ADABAS 5 performance, call toll-free: 1-800-343-5134. ADABAS is a registered trademark of Software AG. © 1989 Software AG.

# OS/2 NEWS

Volume 1, No. 3.

A continuing report on advanced software for personal computers.

**PC/FOCUS provides OS/2 users with data base management across multiple hardware platforms.**

PC/FOCUS<sup>®</sup> is a truly comprehensive information management system that allows you to port data and applications across PCs, LANs, minis, even mainframes. In conjunction with host FOCUS

systems, PC/FOCUS offers a transparent access to all the major data base management systems used today. It includes everything needed for decision support, connectivity and true Fourth Generation Application development. To find out how to add depth and breadth to your data management capabilities call Information Builders at 1 212 736-4433.

**Microsoft Word provides OS/2 users with easy-to-use word processing capabilities.**

Microsoft Corporation has announced an enhanced OS/2<sup>®</sup> version of its popular Microsoft Word<sup>®</sup> word processing software. The OS/2 version of the full-featured word processor allows you to link text, graphics and spreadsheet data quickly and easily without exiting the program. In addition it includes speed keys, macros and other short cuts to help you whiz through lengthy documents. The OS/2 version of Microsoft Word helps you produce high-quality documents on over 150 printers and includes full laser support. For more information on how Microsoft Word can help you, call 1 800 426 9400.

**Manage your personal information with Lotus Agenda for OS/2.**

Agenda<sup>®</sup> is the personal information manager from Lotus<sup>®</sup> that quickly tracks and organizes day-to-day personal information, including projects, people, meeting notes, follow-ups and ideas. Agenda puts you in control of your personal information and helps you deal with information overload. OS/2's multitasking capability gives you instant access to Agenda while you are working in another program. Lotus Agenda for OS/2 is ideal for managers and professionals. For more information on how Agenda can help you gain control of your personal information call 1 800 345-1043.

**Applications Manager gives OS/2 developers everything needed to create Presentation Manager-based applications.**

Applications Manager<sup>™</sup> from Intelligent Environments is an advanced, high-level environment that uses a structured "code" and a WYSIWYG screen painter to help you develop applications to run under Presentation Manager.<sup>™</sup> With Applications Manager you applications

Applications Manager can help you solve Presentation Manager development problems, call 1 800 669-2797.

**Professional ORACLE for OS/2 relational data base introduced to give you more portability, connectivity and capability.**

ORACLE<sup>®</sup> data base management system delivers the power and versatility that application developers require for solving the most demanding information management problems. And because ORACLE is hardware-independent, the applications you develop with it run unmodified on mainframes, minicomputers and workstations. To find out how ORACLE can give you more portability, connectivity and capability, call 1 800 ORACLE 1.

**Manufacturers, distributors and assemblers benefit from comprehensive OS/2-based management system.**

California Business Solutions<sup>®</sup> is an integrated modular menu-driven system that helps monitor the entire manufacturing and distribution system. This software package includes inventory control, order entry, invoicing and sales analysis functions. It also allows for processing of accounts payable and accounts receivable, while providing integrated general ledger, fixed asset and financial statement preparation utilities. For more information on how California Business Solutions can streamline your operations call California Software Products at 1 714 973-0440.

**Free OS/2 Application Guide available.**

You can receive a 340-page OS/2 Application Guide that lists and describes over 800 identified applications for the OS/2 operating system. For a free copy of this guide call 1 800 IBM-2468, ext. 120.

can be run as you're developing them. That means that prototyping systems can be built in minutes. Applications Manager is easy to install, build with and run. Interfaces are available to Data Manager using SQL, ASCII or the "C" programming language. For information on how

## NEW PRODUCTS — SYSTEMS

## Data storage

U.S. Design Corp. has expanded its Q-Stor family of storage systems with the announcement of the 650M-byte erasable optical-drive series for Digital Equipment Corp. and Sun Microsystems, Inc. platforms.

The product line reportedly consists of the following: the QT650 single-drive, tabletop enclosure with a power supply; the QD650 two-drive enclosure with power supply; the QS650, a four-drive rack mount or pedestal unit with a power supply. They are priced at \$8,230, \$8,723 and \$17,000, respectively. All units include a 650M-byte erasable drive.

**U.S. Design**  
4311 Forbes Blvd.  
Lanham, Md. 20706  
301-577-2880

Clearpoint Research Corp. has announced a single-slot, 32M-byte memory upgrade.

The DCME-M30/32MB is compatible with the Digital Equipment Corp. Vaxstation 3200 platform and incorporates a proprietary gate array for reducing the number of compo-

nents on the board, the vendor said. The product reportedly allows Vaxstation 3200 users to address the maximum 64M bytes offered by the system. The DCME-M30/32MB is priced at \$11,500, and quantity discounts are available.

**Clearpoint Research**  
99 South St.  
Hopkinton, Mass. 01748  
508-435-2000

## I/O devices

Interface Systems, Inc. has announced a desktop dot matrix printer developed specifically for use with IBM's midrange computer systems.

The ISI 7224-101 operates with the IBM Application System/400, System/36 and 34 and offers draft output at 200 cpi./sec. The unit incorporates a 9-wire printhead and was reportedly designed as a plug-compatible replacement for IBM's 4224-101 and 4224-301 printers. The product is priced from \$3,525, and volume discounts are available.

**Interface Systems**  
5855 Interstate Drive  
Ann Arbor, Mich. 48103  
313-769-5900

A color video copy processor that reportedly produces 6-by-8-in. prints in variations of more than 260,000 colors has been announced by Mitsubishi Electric Sales America, Inc.

The Model CP-200U uses a sublimation dye thermal system and offers a 1,280-dot horizontal resolution, according to the company.

The unit includes a wired remote control with LCD display and is priced at \$7,500, according to the vendor.

**Mitsubishi Electric**  
800 Cottontail Lane  
Somerset, N.J. 08873  
201-563-9889

Iris Graphics, Inc. has announced that its Model 3024 continuous-flow color ink-jet printer will be available in Sun Microsystems, Inc., Sun-3 and Sparcstation families of workstations.

According to Iris Graphics, the Sun-Iris interface will allow customers to print near-photographic-quality color images in format sizes as large as 24 by 24 in.

The 3024 printer is priced at \$75,000.

**Iris Graphics**  
6 Crosby Drive  
Bedford, Mass. 01730  
617-275-8777

## NEW PRODUCTS — SOFTWARE

## System software

Saseoft, Inc. has introduced the KSA System, which was designed to provide a Wang Laboratories, Inc. VS-like operating environment for NCR Tower computer users.

The main shell is very similar to the Wang VS Help processor and includes a procedure interpreter source code comparable to the Wang VS Procedure Language. The product incorporates a C-screen source-code generator utility that allows freehand design of screens. It costs from \$795 to \$1,800. The Santa Cruz Operation Xenix versions for Intel Corp. 80286- and 80386-based machines cost \$695 and \$895, respectively.

**Saseoft**  
P.O. Box 7000-207  
Redondo Beach, Calif.  
90277

213-373-7600

Computer Associates International, Inc. has announced Version 5.0 of CA-Madammon, its network performance monitoring system for the IBM MVS operating environment.

The latest release reportedly

provides on-line Network Control Program (NCP) statistics that allow the user to observe detailed information regarding NCP performance at both real-time and historical reports. Pricing ranges from \$25,900 to \$49,900, depending on system size, configuration and options selected, the vendor said.

**CA**  
711 Stewart Ave.  
Garden City, N.Y. 11530  
516-227-3300

## Development tools

Interleaf, Inc. unveiled a program developed specifically to help contractors meet the Department of Defense Computer-Aided Acquisition and Logical Support (CALS) standards.

The CALS Readiness Package gives users the tools they need to create CALS-compliant documents, according to the vendor. These reportedly include Standard Generalized Markup Language for text, Initial-Graphic Exchange Specification for engineering drawings and CCITT Group 4 for raster images. The CALS software is said to be completely integrated.

*Continued on page 37*

# KNOW ALL THE ANSWERS

Only a DBMS designed to integrate formatted and unformatted data can provide all the answers to all of your information requests. So instead of excuses, demand solutions: the integrated, multi-key processing technology only ADABAS 5 can provide.

# May 16, 1989 IBM makes SAA a reality. Asks FOCUS to join them.

## Here's why:

FOCUS IS LEAD  
IN THE FIELD

Today, FOCUS delivers complete application development and decision support tools to SAA (and non-SAA) hardware and software environments.

In coming months, a complete FOCUS implementation for Presentation Manager, AS/400 and S/370 mainframes will provide the optimum solution for implementing SAA-compliant systems within your organization.

The powerful combination will deliver **SINGLE LANGUAGE SOLUTION FOR ALL PLATFORMS**.

FOCUS is the only language you need for comprehensive application development and decision support on any platform. **COMMON USER INTERFACE FOR ALL APPLICATIONS**.

Develop 100% CUA-compliant applications for any SAA environment, and run those applications in any environment. FOCUS supports:

**UNIVERSAL ACCESS FOR ALL DATA**

FOCUS transparently accesses data from any major DBMS platform in use today, including DB2, SQL/DS, IMS, VSAM, the OS/400 native DBMS, and OS/2 Extended Edition Database Manager. **COOPERATIVE PROCESSING BETWEEN WORKSTATIONS AND HOSTS**

Using FOCUS client/server architecture and SAA communications protocols, you'll be able to offload expensive processing power from host systems and economically sit the load with all FOCUS-supported workstations.

**SUPPORT FOR ALL ENVIRONMENTS**

FOCUS will extend the benefits of SAA beyond the SAA environment. The FOCUS solution is also available today for VAX, Hewlett-Packard, Tandem, Wang and a host of UNIX-based systems including Sun, Apollo, Sequent and Pyramid.

For more information on what IBI is doing to achieve SAA compliant products, send for our free SAA Implementation Kit. Write to Information Builders, 1250 Broadway, New York, NY 10001, or call (212) 736-4433, Ext. 3708.

 **FOCUS**  
Information Builders, Inc.

*Continued from page 35*

with Interface's publishing package and is slated for delivery in June. The program runs on Apollo Computer, Inc., Digital Equipment Corp. and Sun Microsystems, Inc. platforms and is priced at \$40,000 including training and support.

**Interface**  
10 Casal Park  
Cambridge, Mass. 02141  
617-577-9800

Tominy, Inc. has ported its Mach 1 Application Development Environment to AT&T's Unix System V. Version 3.2 for the AT&T 3B2 and 6386 computing platforms, according to the company.

The software was reportedly designed to provide users and developers with a consistent interface to Unix. The product permits integration of multivendor software development and production environments, the vendor said.

A runtime license is priced from \$1,000 to \$5,000, and a development license is priced from \$1,750 to \$30,000. Cost is determined by machine type and number of users.

**Tominy**  
4221 Malibou Road  
Cincinnati, Ohio 45242  
513-984-6605

BSO, Inc. has enhanced the performance of its Simulator Debugger products, according to the company.

Designed for use by software engineers, the products run in a multitester environment to simulate memory and I/O as well as interrupts on the I/O, the vendor said.

The software runs on Digital Equipment Corp. VAX computers and is priced at \$1,750.

**BSO**  
128 Technology Center  
Waltham, Mass. 02254  
617-894-7800

Star Technologies, Inc. has introduced Topgen, database modeling software designed to create databases for the company's Graphicon 1700 Simulator image generator system.

Topgen reportedly allows the user to create, edit and view three-dimensional image generator databases used in real-time visual simulation applications. Applications reportedly include flight simulation, military driver training and ship pilot training. The package is priced at \$39,000 and is scheduled to ship in July.

**Star Technologies**  
515 Shaw Road  
Sterling, Va. 22170  
703-689-4400

Guidelines Software, Inc. has released Guidelines C++ for object-oriented programming environments based on AT&T Unix System V and the Intel Corp. 80386 chip.

The product is a superset of the C language and is ANSI C compatible. Functions reportedly include classes, inheritance, constructors and destructors, data hiding and data abstraction. The software is priced at \$495.

**Guidelines Software**  
P.O. Box 748  
Orinda, Calif. 94563  
415-254-9183

**Guidelines C++ is a superset of the C language**

Ergodic Systems, Inc. has announced Version 2 of MDS32, the company's memory design software tool for Digital Equipment Corp. VAX/VMS systems. Enhancements reportedly in-

clude character- and field-level validation, and extended definable function key support. A run-time option that allows developers to simplify custom application installation is available, the vendor said.

Primary license prices range from \$245 for VxWorks to \$2,245 for VAX 8800 series machines.

**Ergodic Systems**  
2366-A Birchtree  
El Torr, Calif. 92630  
714-380-9719

### Applications packages

Applix, Inc. has announced its All office automation software will now run on Solbourne Series 4 Unix-based workstations from Solbourne Computer, Inc.

The software package also operates in a Sun Microsystems, Inc. Series 4 workstation environment, according to the company.

Allis reportedly enables users to create compound documents that combine text, graphics and database elements. Editing features are also provided.

The product is priced at \$2,495 and will be available for the Solbourne workstation platform in the second quarter, the

vendor said.

**Applix**  
112 Turnpike Road  
Westboro, Mass. 01581  
617-870-0300

Statware, Inc. has ported Statist, its Unix-based statistical and graphics analysis package, to a variety of computer platforms.

According to the vendor, the program is now available to run in several hardware environments, including those from Digital Equipment Corp., NCR Corp., Unisys Corp., Harris Corp. and Sun Microsystems, Inc.

The product reportedly includes a statistical quality-control module, a statistics module and a procedure-writing module and is priced from \$750.

Statware, Inc. has announced the Statistic Oracle Interface Module for all Statist 2.0 platforms. The software package is said to provide access to Oracle Corp.'s Oracle database files and includes data display, insertion and update capabilities.

Pricing for the Statistic Oracle Interface Module begins at \$250.

**Statware**  
Suite 109  
260 S.W. Madison Ave.

# The Terminal Of The '90s Has Arrived A Bit Early.

**Wyse introduces the WY-150.**  
They always said there would be such a terminal "someday". It would have the flexibility and connectivity to operate in virtually any computing environment, while meeting the most exacting ergonomic requirements. And, it would deliver those advantages at an affordable price.

"Someday" is here much sooner than expected.

It's called  
the Wyse  
WY-150, a  
breakthrough in terminal technology  
that will set price/performance standards  
for years to come.

Bridging the worlds of ASCII, ANSI and PCs, the WY-150 offers compatibility with a wide range of operating systems. Including UNIX/XENIX, MS-DOS, Concurrent DOS, PC-MOS, and PICK. With a choice of three keyboards. And typical of Wyse, the WY-150 does it all with stylish design at a price that's also attractive.

The WY-150 also sets new ergonomic standards. Its 78 Hz refresh rate eliminates any hint of flicker. Just as overscanning and a bezel that matches the soft, paper white phosphor erase distracting borders. (Amber and green phosphors are also available.) The oversize 10x16 cell makes each crisp character stand out vividly.

The WY-150 is also part of *SystemWyse*. It links effortlessly with Wyse PCs and multi-user platforms to create uniquely

integrated and cost-effective solutions. Everything is designed, manufactured, and tested by Wyse to work together. And it's all backed by the service and support of the world's leading independent terminal maker.\*

Only one question remains. Now that the terminal of the '90s is here, what are you waiting for? Call today for more information on the WY-150.

**1-800-GET-WYSE**

## MICRO BITS

Douglas Barney

### Let's hear inside scoop

**Messy, messy, messy.** The hottest and most disturbing trend in personal computer software is to sue each other for stealing ideas. In the case of Dbase-computer player Nantucket Corp., those kinds of suits just don't cut it.

Instead, the only two Nantucket shareholders, current Chief Executive Officer Barry G. Rebell and former President George A. Jaurer, are suing each other for millions upon millions.

Like any good lawsuit, the two parties have been slingin' nasty words at each other in court documents — words such as oppression, fraud, malice and recklessly disregarding reality. Wonder what these two say about each other in private?

The suit is of keen interest to customers because it stabs at the very center of Nantucket as a business. Many shops have shunned the sluggish Dbase and opted for the speedier Clipper. By pioneering such features as user-defined functions, Clipper is a Dbase programmer's dream.

But all is not well at this firm.

*Continued on page 47*

## Unix users cool to DOS options

Coprocessors, software emulators still carry disadvantages, limitations

Although users of Unix-based technical workstations have more choices than ever with which to run their favorite MS-DOS applications such as Lotus Development Corp.'s 1-2-3, DOS coprocessors and software emulators have yet to gain a firm hold in the Unix marketplace.

Many observers are bullish on emulators, but some critics see limited potential for emulation programs that mimic the Intel Corp. 8086 instruction set and the Intel hardware coprocessor boards, which are viewed as

a stopgap measure.

Products such as these intend to help engineers run DOS-based host-type applications on Unix workstations available either through Intel microprocessor-equipped add-on boards or software coprocessors such as those from Mountain View, Calif.-based Insignia Solutions, Inc., and Phoenix Technologies in Norwood, Mass.

Engineers ask for DOS applications such as 1-2-3 or Microsoft Word because they "don't want to give up their favorites," said Dan Ness Jr., senior analyst at Santa Clara, Calif.-based market research firm Infocorp.

Steadily increasing CPU speeds of today's market leaders

are easing the problem of processor overhead, which has led to complaints of slower performance when an application is moved from a PC to a Unix workstation.

### Quick action

"It's now clear that CPUs that are hosting Unix are getting faster at an increasing rate," said Phoenix Technologies' Vice-President of Marketing Rich Levandov. He noted that today's 12-to-15-million instructions per second (MIPS) workstations will soon be augmented by 25-MIPS machines from market leaders.

Does a user of a Sun Microsystems, Inc., or MIPS Computer

Systems, Inc. workstation care about having a DOS-compatible window, Levandov asked. "We've found they care a lot," he said. "For a little extra money, they can run all of the DOS applications on their workstations."

Jorge Rodriguez, a consultant at the New York-based investment banking firm Mabon, Nugent & Co., said he tried DOS applications on the brokerage firm's Unix-based Sun 3/60 workstations with Phoenix's VPD/X emulator software but found few advantages to overcome the limited disk space.

"We had tried it," Rodriguez said. "I still don't see the advantage, even at home where I have two PCs. Why should I have a word processor and Unix?"

A Sun user at Deere & Co. in Moline, Ill., found emulation programs to be slow. "To be perfectly honest, we haven't been

## TV station saves time, money with PC network

### ON SITE

BY MICHAEL ALEXANDER  
CW STAFF

BOSTON — As the commercial television industry celebrates the 50th anniversary of the start of regularly scheduled broadcasts, many television stations are scrambling for their survival. With increasing numbers of viewers tuning into cable and satellite television and home video cassette recorders, commercial television stations are under

pressure to cut costs and boost their program offerings.

WNEV-TV, the CBS affiliate in Boston, has invested heavily in information systems technology to manage more efficiently in what it predicts will be an extremely competitive market. The station, which claims to be one of the most highly automated in the nation, has 60 Wells American personal computers on a Novell, Inc. network with five file servers and 65 nodes as well as an assortment of stand-alone PCs and laptop computers.

WNEV-TV also uses more than 80 different computer programs on the network and stand-alone PCs, including software that runs videotape editing equipment and robot cameras that handle routine camera sequences during newscasts.

"We decided on a network instead of a minicomputer because it was more cost-effective," said WNEV systems administrator Steve Cucurso. "But there is also a richness of applications for personal computers. I can't believe how many applications there are out there that are easy to use and functional, especially for creative work. Have you ever heard of being able to edit videotape on a mini, for example?"

Many programs have to be modified or developed in-house

with Borland International's Turbo Basic and Turbo Pascal, he said. "Most of the companies that we bought stuff from and we could not run it on a network, but we found a couple of guys that have helped on get what we needed. It hasn't been flawless, but it is still wonderful."

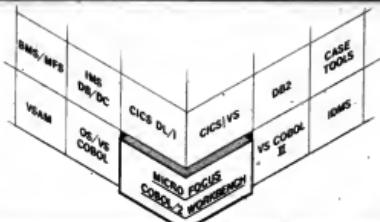

End users on the network use Ashton-Tate Corp.'s Framework III extensively for account-

**"AI expertise and worldwide support from Digital keep Sumitomo Bank ahead in the globalizing of Japan's financial markets."**

Shimpei Hansaka  
Deputy President  
The Sumitomo Bank, Ltd.

"Sumitomo Bank, the world's second largest bank, is working toward the internationalization of Japan's financial markets. We chose Digital's expertise in artificial intelligence technology to give us the high-speed processing capability we need to handle the daily flood of telex traffic. As a result, we feel we are one step ahead of the competition.

"Now, we have one of the world's most sophisticated AI telex funds transfer systems that helps us put the highest priority on the best interest of our customers.

"Digital's years of experience in applied expert systems, as well as their commitment to service and support at every level, has really paid off. It's why we can devote more energy to our internationalization strategy.

"We were looking for an innovative solution. Digital, and only Digital, had the technology and a willingness to work with us to turn our vision of international banking into a reality."

**The rewards of working together.**

With Digital's advanced artificial intelligence technology and comprehensive worldwide support, you can stay ahead of the competition.

Today, with more experience in applied expert systems along with the support you need at every level, Digital gives you an elegantly simple way for your people to work together more productively, more creatively, more efficiently, more competitively.

To learn more, write to Digital Equipment Corporation, 200 Baker Avenue, Concord, MA 01742-2190. Or call your local Digital sales office.

A way to work together like never before.

Tandy Computers: The broadest line of PCs in America.

## The Tandy 5000 MC

Our most powerful  
386™ based computer  
...made in America.

The Tandy 5000 MC Professional System is pure performance, from the Intel® 80386 processor operating at 20 MHz to the fast memory with cache controller that provides rapid access to your data.

With the 5000 MC, you have the high-performance platform needed to take full advantage of industry-standard MS-DOS® applications, powerful new MS OS/2 programs or multiuser SCO XENIX® software.

Operating at 20 MHz, the 5000 MC cuts through the big jobs like database management, large

spreadsheets and sophisticated graphics. And with its IBM® Micro-Channel™ compatible architecture, the Tandy 5000 MC is the ideal high-end PC workstation.

The system architecture also provides high performance in data-transfer rates when the 5000 MC is configured within a 3Com workgroup or multiuser environment.

There's nothing else like it. Compare the 5000 MC to any other 386-based system. The 5000 MC's technology, performance and price all add up to an unsurpassed value.

The Tandy 5000 MC is the new alternative in personal computing. From the best-selling family of PC Compatibles in America.

## SMALL TALK

William Brandel

IBM's game:  
Wait for  
the leader

"Because our customers look to us for leadership," is the answer IBM executives often give when asked to defend the company's forward-thinking technologies. For the most part, the answer is true — customers do look to IBM for direction in computing.

But lately at IBM's low end, the catchphrase is, "Our customers didn't want it yet." The bottom line for IBM customers: wait and follow. The question is whether IBM is the leader.

Such is the case with SAA Officesserve, a cooperative processing office application package that will allow mainframes and personal computers to work interactively. Users again will wait until it is rolled out next year.

IBM forces one to question its commitment to its low-end customers. Recently, William McCracken at IBM said that "Priority 1 on our dealer profitability" — perhaps someone ought to tell McCracken that customers who have bought into IBM's products to make themselves more competitive, not to be part of a grand strategy. It's nice to know where one sits on IBM's totem pole. As the company increasingly treats its customers like the part that goes in the ground, the position of low-end users becomes more clear.

At Comdex/Spring '89, IBM Entry Systems Division President James Canavino hinted at hidden capabilities in the Micro Channel, calling it an architecture of the future. Whatever happened to, "If we haven't got it, we don't announce it?" IBM is turning its R&D strategy into one of the world's longest running sellotapes. Customers' business needs are today, now, yesterday even. Well, you'll just have to wait.

[IBM, the "leader," has lately expressed only doubt over the acceptance of OS/2, offering rebates on OS/2-related hardware and applications. That is not exactly a halftime pep talk. Two weeks ago at an IBM announcement, not one representative from IBM or Microsoft could think of a single MIS site that has standardized on OS/2.

*Continued on page 47*

## Bus master arrival welcomed

As technology trickles into use, users report enhanced performance

BY WILLIAM BRANDEL  
CB STAFF

Much like a needle in a haystack, users employing bus mastering technology on personal computers are difficult to find. But initial performance results from the rare users of a bus mastering disk controller hint that the long-awaited products are worth the wait.

One of the first bus masters to make it into users' hands is the Micro Channel Architecture (MCA)-based product from Core International, based in Boca Raton, Fla. The bus master product is a 15-MHz intelligent enhanced storage device interface (ESDI) Winchester disk drive controller compatible with Micro Channel systems.

Bus mastering technology is one of the primary expiations of IBM's Micro Channel Personal System/2 machines, as it allows processors other than the CPU to take control of the bus.

The technology, which IBM has been touting since the introduction of MCA in April 1987, is expected to incite an innovative approach to personal computing, since it will support intelligent storage subsystems such as the

Core International disk controller.

Other bus master applications will reportedly include separate communications device processors as well as processors that sort databases and manipulate high-power graphical images.

## Few deliveries

IBM has stated that it will use bus master technology in order to upgrade its PS/2 users to higher speed processors such as the Intel Corp. 80486 reduced instruction set computing processor on a bus master add-in card.

But much to IBM's embarrassment, very few bus masters have reached users' hands, despite the high demand for the products. Many users who bought into the Micro Channel have said they did so specifically to implement bus mastering applications.

"There is definitely a noticeable improvement with the bus master," said Bob Reigle, networking specialist at Prudential Capital Management Corp. in Newark, N.J., a subsidiary of Prudential Insurance Corp.

Reigle said Prudential is trying to measure the performance

of its business development team, which is responsible for "creative financing."

The team's latest achieve-

ment is the new bus master product and plans to install it in other LAN servers to support 15 other Prudential regional offices.

The Core Technology bus master controller can be installed with up to four ESDI hard disk drives. It supports dual-sector buffering, has an on-board di-

## All bus-bus

*Bus masters are an integral enhancement to IBM's Micro Channel Architecture. Products soon to be available will afford processing from the CPU for the following applications:*

- Scientific applications using the Intel 80486 processor to boost computing power
- Intelligent control of token-ring networks
- Ethernet network power and control
- Intelligent control of enhanced small device interfaces
- Facsimile transmission for image-processing applications

—JIM WINSTON

ment is delivering Compaq Computer Co. a loan to build a manufacturing plant in Houston.

rect-memory access control and can coexist with the standard ISA controller.

The Core product operates in 256K- and 512K-byte sectors and can support up to 12 drives with more than 1,024 cylinders. It has a 15-MHz data transfer rate and a 15-msec disk seek time, the company said.

Atena Life and Casualty Co. is hoping the Core International bus master controller will boost its PC LAN user response time by a factor of three, according to Dennis Kearns, Atena LAN manager.

Kearns had ordered but not yet received his bus master and said he plans to install the Core controller in his PS/2 Model 80.

He said his 55 PC LAN users now face a seven-second response time, and he wants to cut it to two seconds.

Kearns and he will also suggest the controller with a Token-Ring bus master to further increase LAN speed as well.

## Microsoft hits low end with Pascal compiler

BY PATRICK WAURZYNIAK  
CB STAFF

REDMONT, Wash. — Microsoft Corp. last week began shipping Quickspace Pascal, a low-cost version of its professional Pascal language compiler that uses object-oriented programming and is said to be competitive with the market-leading \$100 Turbo Pascal 5.0 now offered by competitor Borland International.

Quickspace follows Micro-

soft's earlier releases of its high-end Pascal Compiler Version 4.0, a \$395 product intended for scientific applications for MS-DOS or OS/2.

Microsoft's Quickspace program offers an integrated debugger in the base product, which reportedly has a seamless development environment with a windows-based editor supporting multiple views into a source file, or simultaneous editing of multiple files, Microsoft said.

The program's documentation includes Quickspace Advisor, hyper-text-based documentation that comes with Microsoft's languages and Quickspace Express, an on-line,

computer-based tutorial.

Microsoft Quick languages product manager Greg Lobdell said that although Quickspace was a joint project between Microsoft and Paris-based Natysoft, it was developed at Microsoft's headquarters here.

## Trend of the future

Quickspace itself was written in the Quickspace language using the object capability of the programming language, which has extensions to Object Pascal, an Apple Computer, Inc. version of the language.

Lobdell said object-oriented programming (OOP) would be the major programming development of the next decade.

"Virtually everybody in the industry is saying OOP is the way to structured programming," said Lobdell. "Quickspace is the first step in a long staircase toward the nirvana of having a computer on every desktop and in every home."

The program, which requires 512K bytes of memory, two double-sided disk drives and MS-DOS Version 2.1 or higher, will retail for \$99.

## Rainbow patrol

BY MICHAEL ALEXANDER  
CB STAFF

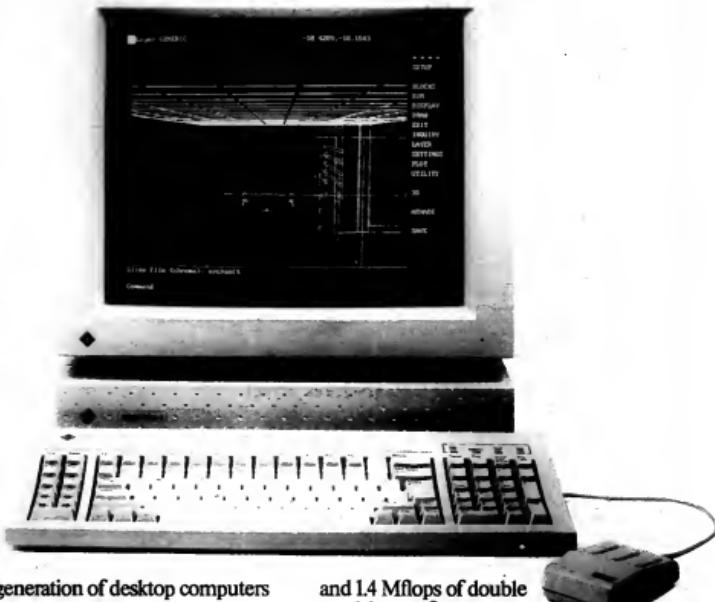

Protecting sensitive data on desktop and laptop personal computers can challenge even the most diligent end users. But Rainbow Technologies, Inc., an Anaheim, Calif.-based vendor of hardware keys for software and data protection on IBM and Apple Computer, Inc. Macintosh personal computers, said in a recent announcement that its new Data Sentry II security system will protect PC files from unauthorized access.

The company's hardware and software system for IBM and compatible PCs and laptop computers consists of a personal access key and software that generates a proprietary algorithm to encrypt data files on PCs and secure data for modern transmissions.

To successfully log on to a secured system, a user must have an identification code, password and personal access key that plugs into the parallel printer port on the PC. The key can be removed for safekeeping or can be disabled in the event that it is lost. The system can also work in a multilevel mode to enable a department manager to access a staff member's files.

Rainbow Technologies suggests a retail price of \$195 for the product, including a personal access key, software and cable to facilitate connecting the key to the PC's parallel port.

# SPARCSTATION 1. POWERFUL DESKTOP

The next generation of desktop computers is here today.

The SPARCstation 1™ from Sun Microsystems.™

A miracle of RISC miniaturization, integration and innovation, the SPARCstation 1 sets a new benchmark of price, performance and functionality by which all others must be judged.

Simply put: for less than \$9,000\*, the SPARCstation 1 gives you more power integrated with more features than any other desktop computer in the world. Making it the world's most powerful desktop.

The SPARCstation 1 is smaller than an IBM PC yet it gives you 12.5 Dhystone MIPS

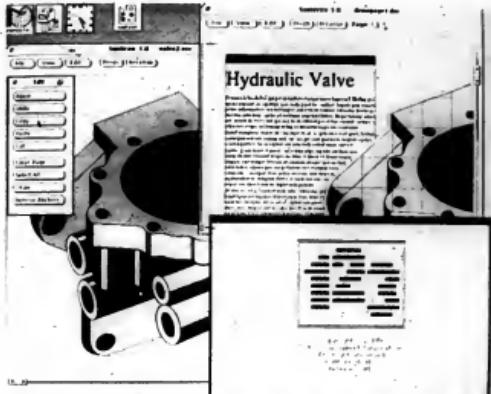

and 1.4 Mflops of double precision performance.

That translates into three times the power of the most fully loaded and hotly accelerated PC or traditional workstation.

*The SPARCstation 1. It may look small but when you compare its power and features to anything else on the market, it's clearly the world's most powerful desktop.*

# THE WORLD'S MOST FOR THE PRICE OF A PC.

*OPEN LOOK™ gives you all the power of UNIX™ with an interface that's as easy-to-use as the easiest-to-use personal computer. Point at an icon, click the mouse button and your SPARCstation 1 goes to work at blinding speeds. Shown here SunWrite, SunPaint and SunDraw working with Lotus 1-2-3.*

And with our high-performance GX Series, the performance curve goes right off the chart.

A major technological breakthrough in computer graphics, our SPARCstation 1 GX produces up to 400,000 vectors a second. Giving you two times the graphic performance of any machine twice its price.

And it doesn't just speed up 2D and 3D wire frame applications, it speeds up the overall performance of your system. Including windowing and scrolling through text.

And the list of firsts goes on and on.

The SPARCstation 1 has a new very high speed bus that delivers many times the performance of a Micro-Channel architecture.

Which makes it very easy for your SPARCstation 1 to expand, connect and communicate with other devices.

From Laser Printers to Ethernet gateways.

The SPARCstation 1 comes packed with a full eight megabytes of RAM. Expandable up to 16 megabytes. With your choice of a high resolution monochrome/grayscale or color display.

It integrates up to 208 megabytes of hard disk storage. A 3.5 inch IBM compatible floppy disk drive. Built-in 32-bit Ethernet. A blindingly fast SCSI connection. Expansion boxes for up to a gigabyte of additional disk or tape storage.

And it's all enclosed in a 16 inch square box that consumes less energy than a 100 watt light bulb.

If you still need more, there is.

The SPARCstation 1 is the ideal machine for voice mail and multimedia applications. It has its own built-in speaker and microphone jack to record and playback music, voice or any other sound you like to hear.

What's more, the SPARCstation 1 is a member of a whole family of SPARCstations and high-capacity SPARCservers.

To hear all the details on the world's most powerful desktop and the other members of the SPARC family, call 1-800-223-6736. Or in California, 1-800-322-6736.

And get ready to set off a few sparks of your own.

*For 3D applications, the SPARCstation 1 GX lets you interactively manipulate 3D objects at speeds that make ordinary workstations seem downright sluggish.*

**Sun**  
microsystems

Systems for Open Computing™

## Unix users

CONTINUED FROM PAGE 39

real happy with Sun's PC emulation or DOS Windows," said Arnie Taube, senior engineer at Decent Technical Services.

The Decent division which makes extensive use of networked workstations experimented with an IBM Personal Computer AT coprocessor card in one Sun workstation, Taube said, but found relatively slow disk access and poor mouse response using DOS applications.

"Using a mouse-based application such as Microsoft Word on the workstation is very slow, very sticky and very inconsistent," said Taube, who added that, based on those results, the firm decided

not to add any more coprocessor cards.

Apollo Computer, Inc. touts using DOS applications in the Unix market for engineers to gain productivity in general business tasks. "The basic axiom is that the user does not want two machines on his or her desktop," said Mike Dillon, Apollo's program manager for commercial markets.

Ness is not convinced that the market for software emulators will take off fast or stay around for the long run. "I look at it more as a bridge, a way to use the existing [DOS] software, but it really doesn't give you the full use of Unix," he added. "Just because you can emulate one environment doesn't mean you can automatically get the best of both worlds."

Nearly half of an engineer's time at

Unix workstations is consumed by non-engineering work, said analyst Paul Cubbage at Dataquest, Inc., a San Jose, Calif.-based market research firm.

"We found that about 40% of general use of workstations is so-called business tasks," said Cubbage, who noted that engineers spend about three-quarters of time on general productivity applications such as electronic mail, graphics presentation, report writing and budgeting.

Cubbage said the largest market is word processing, which some users still accomplish through older Unix tools such as the Typesetter Runoff program Trott, a precursor to word processing programs. Others use Unix office automation packages such as the Aegis integrated package from Applix, Inc., with integrated word

processing, spreadsheet and electronic mail capabilities. Still, Cubbage added, "Very few engineers have DOS compatibility on their workstations."

"The emulation products are just kind of getting out to the market," said Cubbage of SeiPC and binary conversion software called XIOS from Mountain View, Calif.-based Hunter Systems. "It's so new that it's a nonsequitur."

## TV station

CONTINUED FROM PAGE 39

ing, telecommunications, word processing and database management. "When we first got into computers four and five years ago, I wanted something that was easy to use and did not require a lot of training time," Curcuru said. "We're under pressure all the time because this is a TV station, and I did not want a high learning curve."

The station's videotape editors use the network to operate computerized editing equipment to meet tight deadlines for the evening news broadcast. The system has been designed to be as easy as possible to use, in part because the videotape editors are not particularly adept computer users, according to Curcuru.

"The actual functionality is just about as good as what you would get with a \$100,000 dedicated videotape editing machine," he said. "And unlike a dedicated machine, when it is not being used for editing, it can be used for word processing or a multitude of other functions."

By using the network for videotape editing, an editor's learning time is shorter than with stand-alone systems, and there is an audit trail that allows the system administrator to monitor the amount of time spent on individual projects and track excessive personal use of editing facilities, Curcuru added.

The station also uses a stand-alone PC, with an Intel Corp. 80386 microprocessor to operate a robot camera during special portions of the newscast. Most of television commentaries work as fairly routine during a newscast, and a robot camera can be manipulated by a PC to step through a prescribed sequence of camera shots, Curcuru explained.

"With a robot camera instead of a four-man camera crew, you only need two men, so there are salary savings and increased productivity," he said.

The station's use of automation to cut costs and boost productivity has been so compelling that WNEV-TV has been visited frequently by other television stations and newspapers that are looking for techniques and information for implementing similar operations at their own sites. "We have been talking to our chairman about what we know because we think it is valuable," Curcuru said. "With the cost savings, we're looking to be more effective."

WNEV-TV is also in the midst of analyzing software packages intended to bring automation to newswroom operations. But the programs that he has looked at do not go far enough, Curcuru said.

"Our concept of what a newswroom package should do is bigger than what is out there," he said. "We're looking beyond using it just to write scripts to using it as a control center for the entire newscast with videotape editing, robot camera control and more."

# Give your database problems the one-two punch.

Knock hundreds of dollars off the full price when you buy dBASE IV upgrades from Software Spectrum.

Upgrading to dBASE IV™ is a winning decision. Especially when you've got Software Spectrum in your corner. We're one of the few resellers sanctioned by Ashton-Tate to provide dBASE IV upgrades. And we knock ourselves out to make your upgrade quick and inexpensive.

Registered dBASE users can upgrade for only \$165. That's over \$275 off our full price. Or, if you're buying dBASE for the first time, you can get dBASE IV from us for \$449. And still save a whopping \$346 off the suggested retail price.

The media heavyweights have declared dBASE IV the winner by technical knockout. *Computer Currents* says, "It will dominate the MS-DOS and OS/2 market during the next two years." And *BYTE* raves, "It represents a quantum leap... in functionality, power and ease of use."

dBASE IV is a hit with users, too. Its highlights include an intuitive Control Center interface, Query-by-Example and a built-in menu editor. And don't forget what makes dBASE IV much faster than before:

So ring up great savings on dBASE IV. Just give Software Spectrum a ring at 1-800-624-0503. Call us today to arrange upgrade services or to open a corporate account.

## Barney

FROM PAGE 39

Jurors have maintained in court documents that ReBell has been siphoning money from Nantucket for trips and other "personal uses." He also alleged in these same documents that ReBell has been transferring Nantucket funds to other ReBell-owned funds with oddy suggestive names such as Auriferous, Inc., and Hilarian, Inc. Strangest of the bunch is Flatulence, Inc. This purveyor of tasteless greeting cards isn't selling software.

A Nantucket representative who asked not to be identified disagreed nearly all of Juarez's counterclaims, especially the conclusions drawn from the facts Juarez presented. The source said that ReBell signed a note for \$343,500 loan that he is currently paying back.

According to the "Software Industry Bulletin" newsletter, ReBell's record included a guilty plea to check forgery in 1966 and a 1979 conviction on four counts of grand larceny, which carried a four-year sentence in a California state prison. Ironically, Juarez was ReBell's attorney from 1982 to 1984 but never represented him in a criminal case. A Nantucket source commented that 1979 incident did not confirm or deny the alleged 1966 plea.

If you buy the charges against the once-Marine and Vietnam vet Juarez, the ex-Nantucket president deceived ReBell into granting a generous employment contract. Then, ReBell's suit argues, Juarez went on to mismanage Nantucket to the brink of bankruptcy. If you buy the charges against ReBell, then customer dollars are not being sunk into R&D but into pleasure trips, greeting cards and other nonproductive uses.

### J. R. syndrome

It is doubtful that anyone on the outside knows the truth. I certainly don't and only report the allegations, bizarre as they are. But it is clear that some smaller low-profile firms are run as if the offices watch *Dallas* and see J. R. Evans as a role model. This makes the volatile, prone to failure and, in some cases, downright bad.

It is not certain that any of these adjectives apply to Nantucket. Its chief financial officer reports healthy profits and a growing stable bottom line.

For the sake of Clipper users who have invested hours and dollars in developing applications, let's pray that these suits get resolved and that new versions of Clipper come out that continue to push Ashton-Tate to develop better versions of *Dallas*.

## Brandel

FROM PAGE 43

Sure, they're out there, but scant. Follow the leader.

Then the leader announced its long-awaited portable system to replace its ill-fated convertible. Customer response does not suggest that IBM is any more in touch with the portable

market this time. A 21-pound, \$48,000 batteryless laptop suggests only that IBM is targeting an elitist market.

Did I mention the \$350 leather designer case? When asked what a customer should do if he is slotted only \$4,000 to buy a portable, IBM's McCracken said "Wait."

With the exception of its gutsy move to the Micro Chan-

nel Architecture, IBM has done nothing in the last two years to suggest leadership. While companies move as little like technology to unchanged frontiers, IBM takes a wait-and-see approach. You get to wait with it.

Compaq rolled out the first 386 system and gave its customers a 386SX system months ago. Anyone taking bets on which of the two companies

rolls out the 33-MHz 386 first? Does a yellow rose of Texas come to mind?

So, in IBM's idea of leadership, we see what Compaq rolls out and then try to underprice that computer and outdistance it in the dealer channel! Sounds like a familiar strategy.

Brandel is a Computerworld senior writer.

# Imagine working 26,000 hours without a break.

## NEW PRODUCTS

**Systems**

Laserdata, Inc. has introduced the second generation of products for its LaserView document imaging systems.

**Corvette Scanning** and **Corvette Viewstation** display images in less than 0.5 sec., four times faster than current LaserView workstations, the vendor said. Both Corvette units offer a 19-in., 150 dot/in. resolution landscape monitor with a flexible windowing scheme, which reportedly permits users to view text and image windows simultaneously.

**Corvette Scantation** offers the additional capability of scanning documents at 20 page/min, according to the company.

**Corvette Viewstation** costs \$8,995, and **Corvette Scantation** is priced at \$33,850. Volume discounts are scheduled to begin July 1.

Laserdata  
10 Technology Drive  
Lowell, Mass. 01851  
508-937-5900

Lundy Electronics & Systems, Inc. has introduced the Lundy 1612 Personal Graphics Workstation for computer-aided design, medical imaging, mapping and electronic desktop publishing applications.

The unit reportedly features a 20-MHz, Intel Corp. 80386-based processor and offers a 19-in. 1,600- by 1,200-dot high-resolution color raster graphics display monitor. According to the vendor, it includes 1M byte of display list video random-access memory, which is expandable to 4M bytes; eight IBM Personal Computer AT-type expansion slots; and a 110M-byte hard disk drive.

**IBM Video Graphics Array** options are also available.

The Lundy 1612 is priced at \$16,500.  
**Lundy**  
Computer Graphics Division  
1 Robert Lane

516-671-9000

**Software applications packages**

Computer Solutions, Inc. has introduced the Growthpower Powerstation, a manufacturing resource planning information system for personal computer-based productivity packages.

The product was designed for use with the Hewlett-Packard Co. HP 3000 line of computers and the HP Image database in manufacturing environments, the company said. It reportedly provides managers with relational access to information in the Growthpower and Image databases by issuing industry stan-

dard SQL requests directly from the PC.

Features include a point-and-shoot windows environment with a graphical user interface, and both executives and non-technical workers have access to data for "what if" analysis functions, according to the vendor.

Prices start at \$7,390 for the HP 3000 and \$395 per PC, depending on number of workstations.

# Free refills through August 31st.

**Version level upgrade with purchase.** Buy Novell SFT NetWare® or a NetWare® SNA Gateway™ through August 31st, and get a certificate for a free version level upgrade. Then, one time during the next 12 months, you can update your Novell network operating system or gateway to the latest version. **Absolutely free.**

**SFT NetWare.** SFT NetWare is the only LAN operating system software that offers the sophisticated features and functionality available on mainframes and minicomputers. Features like multi-level security, resource accounting, and the industry's most advanced system reliability. Advanced features that make it today's workgroup computing standard.

**NetWare SNA Gateways.** NetWare SNA Gateways have set a new standard for reliability in LAN-to-mainframe connectivity. A standard which extends your

information resources beyond the workgroup. Your network users can now access powerful mainframe databases and applications, and share important company information at the desktop. And do so with unsurpassed reliability and control.

See your Novell Authorized Reseller. To get today's most advanced networking products, see your Novell Authorized Reseller, or call 1-800-LANKIND. But hurry, this free refill offer ends August 31st.

**For network solutions,  
you should be seeing red.**

\*Upgrade is limited to new feature upgrades such as SFT NetWare v2.12 to v2.15, and does not include product architecture upgrades such as SFT NetWare v2.X to v3.X. Novell product manuals will be offered at a discount as part of this promotion.

## DATA STREAM

Elisabeth Horwitt

### Rough and stumble

Where are the micro-to-mainframe pioneers of yesterday? Well, several have disappeared entirely, while others are recovering from rough times. I find this sad, considering that several of these companies were the first to offer the kind of useful micro-to-mainframe access tools that users take for granted today.

For example, in the early 1980s, Microshare in Montreal helped popularize the concept of the virtual disk, to enable users to access and store files on the mainframe as if it were just another disk drive on the PC. Linkware took that idea a step further by providing "virtual servers" — a mainframe "staging area" that is separate from the corporate database — enabling IS to provide PC users with extracts from the corporate database in a controlled, secured environment.

Informatics General broke ground by hooking up popular mainframe database environments with popular micro packages such as Lotus 1-2-3 and Phaser Systems' command-line interface to VTAM that lets users with efficient access

## Novell exec defends Netware pace

BY PATRICIA KEEFE  
CW STAFF

The major players in the local-area network market are in the process of moving their technology to more powerful and allegedly more open platforms. It will not be until mid to late 1990 that either 3Com Corp. or Novell, Inc. is able to produce all the pieces necessary to support such claims.

However, 3+Open has been shipping since October 1988, providing interested users with an opportunity to at least test LAN Manager and its relative compatibility with 3+.

Novell's recently unveiled Netware 386, however, will not

Novell's Calkins addresses Netware 386 charges

be delivered until the third quarter at the earliest [CW, Page 15]. So users not only have nothing to

compare with the current Netware 2.15 family but also lack the means of investigating claims by competitors that Netware 386, which was written from scratch, will create serious migration problems.

In response to critics, Mark Calkins, Novell's vice-president of software marketing, took time to separate the wheat from the chaff concerning Netware 386.

First, Calkins estimated that 97% of all network applications are client-based: "The biggest issue is to have to make changes in the client." But since Novell changed the server application programming interface (API), Calkins said, this means that "not one single change is re-

quired" for client-side applications. All the new security, print service and management facility APIs are server-based.

On the server side, back-end services such as a database server, written to Novell's value-added process (VAP) interface will have to be rewritten.

## GE cements MCI portion of network

BY ELISABETH HORWITT  
CW STAFF

FAIRFIELD, Conn. — No wishing to put all of its telecommunications eggs in one vendor's basket, General Electric Co. recently announced plans to sign a multimillion-dollar, three-year contract with MCI Communications Corp. GE was the first company to sign up for AT&T's Tardif 12 service in March 1987.

"Even before we signed up with AT&T, we had a policy that we would be a multivendor shop," said GE director of telecommunications, Stan Weiland. GE has already signed a similar contract with U.S. Space Communications Co., he added.

One of the main reasons for

GE's multivendor policy is the need for redundant backup facilities in case one carrier's network goes down, Weiland said. The widespread use of fiber-optic cabling has dropped prices but increased vulnerability for users' networks, since backup links often run over the same cable as the primary links and are equally susceptible to "a farmer with a backhoe or a man putting in a fence," Weiland said.

### Cut off

GE was one of many businesses affected by the severing of AT&T's main cable for the Northeastern corridor in November, Weiland said.

"Our alternate facilities with AT&T and other vendors al-

lowed us to get back on-line in half an hour when both the 609 and 201 area codes were out," he continued. GE currently uses AT&T's Bandwidth Management Service to provide intelligent alternate routing scenarios over its backbone, Weiland said.

Another reason for continuing relations with Sprint and MCI is it leaves open the option to shop around for network services GE may implement in the future, such as Integrated Services Digital Network offerings and fractional T1, Weiland said.

GE's MCI contract will include volume discounts and provide the manufacturer with the option to use an array of services including MCI's virtual networking system, Vnet, and leased

GE's Weiland endorses multivendor telecom contracts

lines, Weiland said. However, the contract does not include any part of GE's network backbone, "in no way impacts AT&T's status as GE's provider," he said. "We continue to be a very happy [Tardif] 12 user."

## The JAMES MARTIN WORLD SEMINAR

### Putting You On the I.S. Fast Track

In computing today you can find isolated islands of excellence - corporations that have learned to apply technology far more quickly and effectively than their competition.

With this advantage, they have run their competitors right off their feet. They have learned to develop high quality applications fast, with CASE technology. Or they have created a vital competitive edge with expert systems, EDI, mission-critical systems, and integrated networks.

At the James Martin World Seminar you'll learn:

- How to Develop Applications FAST
- How to Maximize the Benefits of New Technology
- How to Streamline Corporate Procedures
- How to Maximize the ROI on Information Systems

Call (213) 394-4386 ext. 28 right NOW to register for the James Martin World Seminar, or to receive a FREE 16-page Seminar catalog.

"THE JAMES MARTIN WORLD SEMINAR — THE SEMINAR THAT SEPARATES THE EXCELLENT FROM THE AVERAGE"

## Apollo launches security tool for networks

BY PATRICIA KEEFE  
OF STAFF

CHELMSFORD, Mass. — Apollo Computer, Inc. recently unveiled a network administration tool said to be the first to manage and secure user log-on and password information across multivendor Unix networks.

The Passwd Etc user registry system runs in conjunction with Apollo's Network Configuration System (NCS), a set of software tools that enable administrators to simultaneously distribute parts of an application across multiple machines. NCS has been licensed by more than 150 vendors, the company said.

Apollo plans to port Passwd Etc to some platforms and make the source code available to others. "We intend to make this a standard on Unix platforms," said Carol Rosenstock, product manager for portable systems administration.

Client software is available immediately for Sun Microsystems, Inc.'s operating system software, and a second port supporting Digital Equipment Corp.'s Ultrix will ship in the third quarter. Apollo will deliver server software for both systems in the fourth quarter, according to Rosenstock. "You won't need an Apollo server," he said.

Individual networks already have their own registration system to manage account information and access to computer

resources. However, Passwd Etc was designed to deal with the complexities involved in assigning unique identities to users attached to distributed, multivendor networks.

"When you pull together multiple distributed networks, you often end up with duplicate names or information, as well as redundant efforts to maintain that information," Rosenstock said.

Instead of storing information on multiple files residing on machines throughout the network, Passwd Etc maintains a single logical database for all information, eliminating the potential for conflicts in log-ons and passwords that can occur in a

multinetwork environment, she said.

The database sits on top of NCS and does not get involved with lower-level network protocols. Specific interfaces based on standard Unix facilities provide access into the database. Anyone trying to make a change must have the necessary privileges.

### It's a secret!

"The user doesn't know this is happening; the security process goes on behind a curtain," Rosenstock said.

The software reportedly works by capitalizing on the distributed nature of the network to minimize the complexity and

overhead of administering large networks.

Since Passwd Etc is database-oriented, it allows systems administrators to make changes and updates automatically. It can also accommodate network growth in both scope and number of users.

Passwd Etc is composed of a server component that allows administrators to maintain a registry database and a client piece that allows the machines on the network to use the registry to log on, change passwords and update personal account information.

It is bundled in with Apollo's DOS/miOS operation system and is standard with all Apollo workstations. Client software costs \$1,000 per site. Server pricing has not been set.

## OSI Network forum gains new members

BERNARDSVILLE, N.J. — Four new members have joined the Open Systems Interconnect Network Management Forum (OSINMF), an international organization dedicated to speeding implementation of OSI standards.

Joining the forum are McDonnell Douglas Network Systems Co., Stratus Computer, Inc., Teletron Communications Systems Inc. and Unisys/Bentley, Inc. Formed last July, the OSINMF now boasts 63 members.

The forum is currently reviewing a draft specification that defines an initial set of applications messages. John Miller, OSINMF president, said the messages team has focused on event reporting and management of objects and attributes present in multivendor networks.

Event reporting functions covered include control of event reporting, control of event logging, a master event reporting function and an event report retrieval function. Also defined are generic models for describing configuration states and configuration relationships for managed objects in multivendor networks. Those objects can include voice and data switches, multiplexors, computer systems and other applications among others.

In January, the group released a protocol specification based on the seven-layer OSI model said to provide the communications infrastructure necessary to support interconnection of diverse network management systems.

# You want your to do more for We hear you.

**Listen to how IBM can get your phones in better touch with your computer.**

Not too long ago, a company could get along just fine with a simple telephone system.

But today, just getting along isn't good enough if you really want to get ahead.

So we'd like to show you how IBM can get your phone and computer on better speaking terms, to help make your company more productive and profitable.

**You can handle more business with the right connections.**

With IBM's voice response unit, customers can access your computer data base with their telephone without operator assistance. They can call in and place orders or get information simply by pushing buttons on their phone.

## Paine Webber raids communications costs

### ON SITE

BY ROBERT MORAN  
CW STAFF

**NEW YORK** — Prompted by lean times in the securities industry, Paine Webber Inc. has initiated a strategic attack on communications costs that has paid off in multimillion-dollar savings.

The company began its strategic assault last July and to date has saved \$4 million. Terence McSherry, vice-president of communications, said he expects to save \$10 million this year and \$12 million in 1990.

With about 300 U.S. offices, Paine Webber's communications costs average more than \$100 million per year, behind only real estate, salaries and compensation, McSherry said. This scenario is common in the securities industry, added Lou Capone, president of DP Communications Corp., a communications consultancy in New York.

Economic survival mandates that securities and brokerages drive down the cost of a transaction, Capone said, but telecommunications managers are not shrinking the cost of services rapidly enough. "Failure to drive down costs will give business to the competition," he

said. "The control of the network is the control of your future."

Paine Webber took fate into its own hands by developing a cost-cutting plan, establishing goals, organizing teams and developing project schedules.

McSherry initiated 21 projects, assigning project managers to limit down cost areas in individual networks and branch operations. In addition, the company instituted contract and billing reviews, while also taking a tougher stance with vendors.

Using tracking and evaluating mechanisms, an MIS financial group established baseline costs and now reviews all bills for

circuits, equipment and other charges.

"In many cases, we found mistakes amounting to hundreds of thousands of dollars and are now getting reimbursed," McSherry said. For example, Paine Webber found that services that should have been disconnected were still in place as much as a year later, he said.

### Never end cheaper

Reviews of branch offices prompted the removal of older Cablesys systems for less expensive state-of-the-art private-bracket exchanges such as the Northern SL-1 series from Northern Telecom, Inc. and the System 75 from AT&T.

A review team found that the company could save \$1 million annually by building its own T1 backbone network. According to McSherry, the network, which is currently under construction, will replace the company's multiprotocol data network. In addition, the company now uses virtual networking techniques for its switched voice network.

McSherry said that such savings must be made visible throughout the organization. To that end, Paine Webber publishes its progress, holds scheduled progress meetings and rewards project managers with cash for saving the company money.

McSherry cautions organizations to scrutinize contracts with an eye for their duration, options, renewal clauses, the presence of escape clauses and the economics of leasing vs. purchasing. In addition, managers should seek bulk discounts and try to achieve national account status, he said. McSherry encouraged competitive bidding because, he said, "vendors always sharpen the pencil" to deal.

### BIT BLAST

## CCITT close to V.42 bis approval

A study group within the Consultative Committee for Telephony and Telegraphy is said to be accelerating the process for standardizing V.42 bis, a data compression standard designed to work with the V.42 error-correction standard for modems. A draft of the V.42 bis specification was accepted by the study group in March; final acceptance is pending until a meeting scheduled for this fall.

The group decided to base the standard on an enhanced version of an algorithm developed by AT&T subsidiary Bell Laboratories. The standard is said to allow a 9.6K bit/sec. modem to handle throughput of 30K bit/sec. for text and 38.4K bit/sec. for spreadsheet files over dial-up connections.

Century Software in Salt Lake City claims to have released the first A/UX communications package. Century souped up its existing Telnet communications program with Apple Computer, Inc. A/UX compatibility. With Telnet Version 6.1, A/UX users can perform file transfers and terminal sessions under a number of environments. It may be a while before any other vendor joins Century. David Kosier, editor of "Connections," a newsletter on Apple connectivity, said Apple is not selling many units of A/UX. However, the next upgrade may change that: It reportedly will include a finder and a Macintosh-like interface and ship late in the third quarter, he said.

# phone system your business.

And automatic call distribution can make your operators more efficient. Incoming calls can be routed to operators who are least busy. And the number of calls can be tracked, so you can schedule shifts for peak periods.

You can even do business when your office is closed.

Today, more companies than ever are doing business around the clock, and around the world. With the PhoneMail® voice messaging system, your business can operate 24 hours a day. So your customers and sales force can reach your office at any time.

These are only a few of the ways IBM can integrate your voice and data systems to help make your company more productive.

If you'd like to hear more about how IBM voice solutions can work for you, just call your IBM or ROLM Representative or for a demonstration.

COMPUTERWORLD

## Netware

FROM PAGE 51

to conform to the new Netware Loadable Module interface. Calkins said only 15 or so applications were written to the VAP. During the interview, he also ticked off rebuttals to the following charges or queries:

Since all APIs were rewritten, this will require a total rewrite of applications and drivers. Netware 386 will support all existing 286 applications. But those applications will have to be rewritten to fully exploit the 386. A new developer's tool kit and C-based library should ease the transition according to Calkins.

Lee Doyle, an analyst at International Data Corp., a market research firm based in Framingham, Mass., predicted Novell may be less successful at getting large software houses, as opposed to small Netware-specific developers, to move their applications to Netware 386. He cited direct competition from LAN Manager as one factor.

Novell's APIs are tied to the chip and not an operating system. API changes resulting from the move to a new platform

are related to the "quantum leap" in functionality between the two Intel chips — i.e., 16-bit vs. 32-bit processing. As there is little difference between the 386 and the 486, any changes to Netware as it moves to the new chip will be slight, if at all.

Differences between the 286 and the 386 in the way memory is moved and processed occur internally and will affect developers. "Balance," Calkins said. "Dealing with memory is a piece of cake. We'll readily say that, yes, there are some new function calls, and the 15% you'll have to change is not a big deal."

Migration will be a nightmare for administrators. Critics claimed that network administrators will have to cope with a completely new environment. According to Calkins, a lot of the network administration utilities are the same. There are some differences, which administrators will have to learn — for example, a new network station monitor utility. But he insisted users will find Netware 386 easier to install, manage and learn.

The new platform lacks OS/2 server optimization. "We want to make sure that

OS/2 client networking support is there," Calkins said. He admitted Novell's first OS/2 requestor for the client left a lot to be desired. However, feedback from developers on Version 1.1 has been positive, he said: "We are now finishing up on Named Pipes support and making the conversion of all Netware utilities" for a late June/early July release.

Will the Microsoft/Ashton-Tate-SQL Server run on Netware? "Named Pipes support is all it takes to run SQL Server on Netware," Calkins said, adding that Novell announced plans to do this a while ago. "All you'll need is an OS/2 environment with Named Pipes on top of the transport protocol."

Clean upgrades will be difficult because Novell lacks standard transport protocol support. But Novell did announce what it calls a protocol engine architecture. At the low end is the Open Data Link interface co-developed with Apple Computer, Inc. At the upper end will be the new Netware Streams, which is based on the Unix standard. Novell has also said it will provide Transmission Control Protocol/Internet Protocol and Open Systems Interconnect support by 1990.

## What to make of it?

Users had better brace themselves for the coming heat wave. New technology platforms produce more than just promises of increased speed, memory and storage. They also serve to provide fodder for a blast of vendor claims and counterclaims that serve mostly to stall MIS buying decisions.

When the rival suppliers involved are Novell and 3Com, the barrage of words and statistics really fall hot and heavy.

Users considering the purchase of these new generations of network software from local network firms Novell and 3Com might want to consider two routes. Migration to both Novell's Netware 386 [CW, May 15] and 3Com's OS/2 LAN Manager-based 3+Open are hung up on the same snags — application portability — and analysts estimate that users migrating up from either platform will encounter about the same degree of difficulty.

Regardless of network brand, in each case a server based on either platform will support its predecessor, i.e. Advanced Network and SPT' Netware or 3+. However, to exploit the capabilities of the new servers — whether an Intel Corp. 80386-based box or LAN Manager API — programs will have to be rewritten. In both cases, many of these changes will be shielded from even the developers, said Lee Doyle, an analyst with International Data Corp. However, users hoping to exploit the particular capabilities of these servers will have to wait until rewritten applications are ready.

While they wait, users might want to consider the tradeoffs involved in migrating to the latest versions of both brands of network software. Is the trauma of having to learn new commands or procedures and having to rewrite various programs worth the net gain in features and user productivity?

PATRICIA KEEFE

# Look where our information systems are today.

It might surprise you to learn that our own aerospace companies are among our biggest customers. But it's true. And it makes a lot of sense. We wouldn't have been able to develop such sophisticated products unless we developed

## Horwitt

FROM PAGE 51

to a variety of IBM mainframe environments.

Here is where these companies are today:

Microtempus went through serious financial trouble a couple of years back, culminating in reorganization and the replacement of its then-chairman with Larry DeBoever, an independent consultant and, interestingly enough, former president of Linkware. Microtempus has been profitable now for several quarters and is also on the verge of a major announcement, according to DeBoever.

Informatics General no longer exists; Sterling Software bought it several years ago. Likewise, Linkware got folded into Ungerman-Bass and hasn't been heard from since.

Pioneer, based in San Francisco, was rescued from Chapter 11 a couple of years ago by Novell President Ray Noorda. Soon after, the company announced products to provide interactive communications between PCs on a Novell Netware local-area network and remote and local IBM hosts.

The company is "not doing as well as we'd like," one spokesman said. But it is preparing a

"major announcement" in the next few weeks that will include a local, channel-attached host gateway for Token-Ring networks and will improve throughput by a magnitude, he said.

No question but that it's tough to be a successful micro-to-mainframe software company these days. Particularly micro-to-IBM host software. The Big Guy keeps changing the rules of the game, and vendors need to second-guess which of IBM's innovations will be user must-haves and which will quietly drop by the wayside.

For example, most of the vendors we've talked about so far support LU6.2 in one way or another. But few vendors have had a lot to say lately about IBM's Extended Communication Facility (ECF) and Service Requestor Programming Interface — either as products to support or as potential competitors.

According to one software developer, IBM went off track for a while, with its sales representatives neglecting the potentially strategic ECF in favor of Netview Distribution Manager, which was initially designed to distribute applications between mainframes and System/36s

## Financial EDI sees growth checked

BY ELLIS BOOKER  
CW STAFF

CHICAGO — "The check's in the mail" retains its literal meaning for U.S. companies, precision few of which are using electronic funds transfer (EFT), a subset of electronic data interchange (EDI), as their preferred method of invoicing and payment.

"Paper is the way you do business in the financial arena," David M. Ferguson told an audience of 200 people at the Corporate EFT and Financial EDI Conference here earlier this month.

Only 2.5% of U.S. and Canadian corporations use EDI, said Ferguson, conference co-chair and president of EDI Research, Inc., a market research company in Oak Park, Ill. He drew that number from his own 1988 survey, which indicated that 93.3% of the firms use traditional paper

correspondence and a growing segment, 4.7%, is turning to facsimile and electronic mail.

For EDI in general, approximately 17% of the companies among it's 14,500 plan to do so, and 57.8% do not plan on using the technology, according to EDI Research.

Still, interest in the financial application of EDI is high. Ferguson said, noting that this year's EDI/EFT meeting attracted about twice as many banking and corporate attendees as last year.

EFT between financial institutions — what could be called the wholesale side of the business — is a well-established phenomenon dating back to the 1970s. The National Automated Clearing House (ACH) network, set up by banks, is the largest U.S. electronic payments system and represents 17,500 financial institutions.

Of the 10 billion or so checks written every year by companies paying other companies, about 3% were handled electronically last year. The reason for corporate enthusiasm is that ACH was originally designed to transmit value, not related financial documents. Only 20 or 30 banks in the country are set up for this full-scale financial EDI, and many still mail customers paper documentation for payments made electronically.

"In the corporate environment, money is worthless without remittance information," explained William G. Cafiero, the senior EDI consultant at GE Information Services. GE's financial EDI network, EDI Express, claims about 4,000 corporate customers and is the market leader among value-added networks offering financial EDI, Cafiero said.

I'm betting on the latter, at least until Officevision becomes the de facto standard for user interfaces. Which may not even happen.

Horwitt is a Computerworld senior editor, networking.

and 38s — and also PCs.

However, rumor has it that IBM is back on the ball with ECF, planning to announce an OS/2 Extended Edition version in the next month or two.

Last week's announcement of Officevision, formerly known

as SAA Office, is also likely to pose a tough choice for micro-to-mainframe vendors. Do they go for the whole banana, including "look and feel," or just set up a connection to the Officevision communications system via LU6.2?

- 1 With EDI\*Net\*, our Electronic Data Interchange service, our MD-80 suppliers get our purchase orders in short order.
- 2 PERMAC2, our Plant Engineering Resource Management and Control System, keeps the equipment that builds our MD-80, MD-H, C-17 and more, in F-16, in topflight condition.
- 3 Production of our Harpoon missile never misses a beat, thanks to ProKit® WORKBENCH®, our computer-aided software engineering tool. Efficiency soars, but costs don't, because we use our spatial database product, GDS, to manage our corporate aerospace facilities.
- 4 With TYMNET, our value added network, data for our C-17 test program flies back and forth between the U.S., UK and Canada.
- 5 UNIGRAPHICS® our CAD/CAM/CAE system, helped us launch our space station program and design the U.S. Navy FA/A.

an expertise in information systems, too.

So if you're looking for an IS leader with experience in real-world applications, call us at 1-800-325-1551.

# Ungermann-Bass, Proteon unfold FDDI plans

BY PATRICIA KEEFE  
CW STAFF

The Fiber Distributed Data Interface (FDDI) picked up support last week, as general-purpose network vendor Ungermann-Bass, Inc. and Token-Ring supplier Proteon, Inc. un-

wrapped plans to embrace the emerging standard for 100Mbit/sec. network transmission.

The vendors plan to release FDDI products in the second and third quarters, respectively, in the fourth quarter, which is when the standard committee is expected to finalize the station management

portion of the standard.

UB also announced completion of the first phase of its first FDDI network — a backbone installed at Microsoft Corp.'s Redmond, Wash., headquarters. When completed, Microsoft's FDDI backbone will intercon-

nect more than 20 UB Ethernet subnetworks, serving 6,000 employees at the 11-building campus.

**Requirements satisfied**  
"This should satisfy our network backbone requirements well into the 1990s," said Joseph Monte-

leone, Microsoft's manager of corporate systems. His UB Net/One network will have the additional capacity to accommodate growth as Microsoft adds more users and subnetworks, as well as supporting voice and video transmission applications in the future.

UB President Ralph Ungermann said the Microsoft project is the first step in an aggressive plan to develop FDDI bridge products within AccessOne. The standards-based network software provides Ethernet, Token-Ring, asynchronous and IBM 3270 connectivity to networked workstations over unshielded twisted-pair cables and other media.

Ungermann said his Santa Clara, Calif.-based company will deliver FDDI bridges to Token-Ring as well as Ethernet. These products will include network management software, migrating the capabilities of Net/One and AccessOne to FDDI.

Westboro, Mass.-based Proteon introduced an FDDI version of its P4200 multiprotocol internetworking router. Positioned as a corporate backbone, it reportedly will interconnect different types of local-area networks across FDDI while also providing direct connections to multi vendor hosts, workstations and routers located on the backbone.

Proteon claimed other FDDI products are frequently limited to vendor-specific communications.

Company President Patrick Courtney said he believes the FDDI standard will be mostly settled by the end of the year. In the meantime, Proteon is working with a consortium of other vendors — including Sun Microsystems, Inc., Apollo Computer, Inc. and Prime Computer, Inc. — to ensure interoperability between FDDI implementations.

Current P4200 router users will receive a 35% discount toward the FDDI upgrade.

## Blast-off

Last week, Fibrecom, Inc. in Roanoke, Va., announced that it had been selected by the National Aeronautics and Space Administration to design and produce components for what it claimed will be the first FDDI network to be built in space.

Fibrecom has agreed to develop ring concentrators for an FDDI LAN network that will provide space station Freedom's personnel with access to a database system designed by IBM, according to the vendor.

Some concentrators will be operating outside the station, so they will be specifically designed to survive in space, according to Fibrecom. The concentrators need to be able to operate in a vacuum while being subjected to wide temperature fluctuations and low radiation for more than nine years without failure or need for repair, the vendor said.

## You need Speed & Performance to beat the competition. That's our ADVANTAGE

**Speed counts.** Speed in implementation and speed in operation. Simply put: Getting at and quickly manipulating large amounts of rapidly changing information makes it easier to ace the competition. ☐ But, with large information system development time measured in years, it's tough to get the edge in today's fast-paced, competitive markets. You can't afford to wait. You need answers today, not tomorrow. You need an information advantage. ☐ *Introducing The Advantage Series.* An exciting new generation of innovative information management tools, an integrated fourth-generation development environment and database specifically designed to implement large-scale information systems in a fraction of the time. ☐ The Advantage Series provides the technology to quickly build very large, performance-intensive applications that access multi-million record databases and support thousands of concurrent users. You can be on-line in a matter of months—not years—running large-scale production applications against very large databases. ☐ Individually, each element of The Advantage Series is extremely powerful.

**MODEL 204, Version 2**—a relationally oriented database management system with unequalled performance and flexibility for handling huge information requirements. **USER LANGUAGE**

—a 4GL specifically designed for rapid development of large-scale applications. **WORKSHOP/204**—Extended application development tools for **USER LANGUAGE**.

**IMAGINE**—an end user query and report writer capable of transparently accessing and merging data from multiple databases.

**HORIZON**—the industry's first complete development package for customized LU 6.2 connectivity in distributed and cooperative environments. ☐ *The new standard for speed and performance.* MODEL 204, Version 2, forms the baseline of The Advantage Series. It delivers the speed, performance and flexibility you need to build complex, dynamic database applications that let you outexecute the competition.

☐ **A 4GL** built for speed and productivity. **USER LANGUAGE** is a 4GL specifically designed for rapid development of complex, dynamic database applications. It supports comprehensive database manipulation and handles both textual and numeric data expressions. ☐ **Network connectivity plus 4GL programmability: an industry first.** **HORIZON** is the first complete distributed application facility for SNA LU 6.2 that lets you cash in on 4GL speed and productivity. Its high-level connectivity and performance lets you get at all your information whether it's across the hall or across the country. ☐ *Your entry point for the IBM enterprise system.* The Advantage Series end user query and report tool, IMAGINE, Release 3.0, gives you transparent access to a wide range of IBM data file organizations... DB2, VSAM, IMS/DB, SQL/DS and DUL. ☐ *The Advantage Series works across the IBM 370 mainframe, mini and workstation family.* The Advantage Series quickly turns even the newest IBM 370 architecture, the IBM 7437 VMSP Technical Workstation, into a powerful competitive weapon. ☐ **Advantage: You.** Because speed kills the competition. ☐ For information on The Advantage Series and a free copy of our technology evaluation guide, "How to Cash In On The Information Advantage," call (807) 492-6880.

## NEW AT DEXPO SOUTH '89

The following products were announced at Dexpo South '89:

\* **Pacshare Software, Inc.** in-LA Jolla, Calif., announced Pacshare, the company's Apple Computer, Inc. Appleshare-compatible file server software package.

Pacshare reportedly enables a Digital Equipment Corp. VAX, Microvax or Vaxstation running Unix to function as a file server for an Apple Macintosh network. Files stored on the VAX system appear to the Macintosh user as icons that can be accessed in the familiar Macintosh style, according to the vendor. Pricing is based on the number of concurrent sessions and starts at \$2,400 per VAX for five concurrent user sessions.

\* **Micron Communications Corp.** introduced the Instigate 1500 Terminal Server Gateway, designed to provide an interface between Ethernet local-area networks and Micron's Instant Data private automatic branch exchange (PABX) or Data Distributor.

According to the vendor, the product is especially suited for current Micron Data PABX users who require interconnectivity to Digital Equipment Corp. Ethernet LANs, or for other Ethernet LAN users who want to add wide-area networking options.

The Instigate 1500 costs between \$164 and \$265 per port, depending on application, and is scheduled for beta-test release in July, the company said. Micron is headquartered in Simi Valley, Calif.

\* **KEA Systems Ltd.** in Vancouver, B.C., has expanded the company's line of terminal emulation products with the announcement of Zlat.

Zlat is reported to be a personal computer-based local-area transport (LAT) driver that allows IBM Personal Computers to connect to Digital Equipment Corp. VAX computers via Ethernet and DEC's LAT protocol. The product requires 35K bytes of random-access memory and will initially support the 3Com Corp. 3C501 Etherlink card and Interlan, Inc.'s NS1601 Ethernet card, according to the vendor.

Scheduled for delivery in June, Zlat will carry a price tag of \$150. Dealer and quantity discounts are available.

## NEW PRODUCTS

### Local-area networking hardware

**Samsung Information Systems America** has introduced an Intel Corp. 80286-based diskless workstation that incorporates four expansion slots, the company said.

Dubbed the PC terminal/286, the 12-MHz unit was reportedly co-developed with Novell, Inc. and is optimized for Novell's Netware local-area network operating system. The product comes standard with 640K bytes of random-access memory, expandable to 15M bytes, and a Netware-compatible boot-programmable read-only memory.

Scheduled for delivery in the second quarter, the workstation will carry a price tag of \$1,795.

**Samsung Information Systems**

3275 N. First St.  
San Jose, Calif. 95134  
408-434-5482

**Asante Technologies, Inc.** has announced the Macos I/US Ethernet interface card for Apple Computer, Inc. Macintosh II computers.

The card reportedly provides 32-bit data transfer and is said to be register-level-compatible with Apple's EtherTalk interface card. It was designed to facilitate networking with IBM Personal Computers and compatibles and is priced at \$595.

**Asante Technologies**  
Suite G  
1050 E. Duane Ave.  
Sunnyvale, Calif. 94086  
408-736-3360

**Madge Network Ltd.** has introduced the Micro Channel Architecture Ring Node, designed specifically for IBM Micro Channel workstations, the company said.

The product is reported to be compatible with IEEE 802.3 and 802.5 standards, and operates under most personal computer network operating systems, including Novell, Inc.'s Netware and IBM's PC-LAN.

The MCA Ring Node is shipped with a complete local-area network support program and diagnostic software, the company said. The product has 3K bytes of on-board memory and costs \$695.

**Madge Networks**  
534 Salem Ave. S.W.  
Roanoke, Va. 24016  
703-982-0638

An Ethernet controller designed specifically for Apple Computer, Inc. Macintosh II has been introduced by Interlan, Inc.

The NI310 Macconnect Ethernet Data Link Controller provides Macintosh users with direct access to 10M bit/sec. Ethernet.

The Ethernet controller runs on Macintosh II, Macintosh IIX and Macintosh IIcx machines and is said to conform to IEEE 802.3 networking standards, the company said.

The product is priced at \$349, and volume discounts are available, the vendor said.

**Interlan**  
155 Swanson Road  
Bensenville, Ill. 60119  
708-263-9929

# Towers of babble.

What we have here, communicators, is a failure to communicate.

An electronic cacophony of disparate subnetworks—PBX's, LAN's, T1's. All working. Each with its own language and agenda.

To handle this information management nightmare, scientists at our NYNEX Science & Technology Center are developing the software system of the future.

### Manager of Managers

From one powerful workstation, the system provides global management, using artificial intelligence to isolate failures and reduce subnet network downtime.

This is only one of our insights into emerging information technologies. For now-minded futurists, a state-of-the-art NYNEX network management solution can answer needs like call accounting, bill verification and configuration management, as well as network planning and design.

## Local-area networking software

Wang Laboratories, Inc., has introduced a networking software interface for the Freestyle personal computing system.

Wang announced Freestyle support for Bayan Systems, Inc.'s Vines, Novell, Inc.'s Advanced Netware, 3Com Corp.'s 3+ Share and 3+ Open and the IBM Personal Computer LAN Program.

Freestyle, which was announced last fall, reportedly combines an electronic tablet, pencil and telephone-like handset with which users can add handwritten or spoken comments to the contents of a data file.

The Freestyle-LAN uses Wang's LAN

Office as a transport medium. Scheduled to be available in the third quarter and priced at \$100 per PC, it permits data exchange within a LAN, with Freestyle PCs in other LANs and with Freestyle PCs in a Wang VS network.

**Wang Laboratories**  
One Industrial Ave.  
Lowell, Mass. 01851  
508-967-1523

Network Research Corp. has announced that its Fusion Network software is now available for Hewlett-Packard Co.'s 9000 Series 200 and 300 Pascal workstations.

Fusion for PWS provides HP 9000 workstation users with Transmission Control Protocol/Internet Protocol multi-vendor networking capabilities, the com-

pany said. The software is reportedly bundled with network management utilities and a programmatic socket library interface for network application development. The product has a price tag of \$1,000.

**Network Research**  
2380 N. Rose Ave.  
Oxnard, Calif. 93030  
805-485-2700

A software product that reportedly allows remote connectivity in IBM Personal Computer, PC XT, AT, Personal System/2 and compatible computer environments is now available from Norton-Lambert Corp.

Close-upLAN was designed for work group conferencing, network support and

management, distributed processing and as a local-area network gateway to mini-computer and mainframe systems, the company said. The product is offered in configurations supporting from two to 64 users, and pricing ranges from \$395 to \$1,995.

**Norton-Lambert**  
P.O. Box 4085  
Santa Barbara, Calif. 93140  
805-964-6767

## Links

IBM has expanded its line of 3174 controllers with the announcement of nine new models. These additions reportedly will replace the first generation 3174s, which will be withdrawn from marketing in August, the vendor said.

According to the company, the 11L, 11R, 12R and 13R models were designed for large establishments and can attach up to 32 IBM 3270 devices and as many as 24 ASCII devices. They are priced from \$10,960 to \$14,260.

The 61R, 62R and 63R controllers are reported to be intermediate-level offerings and provide support for as many as 16 IBM 3270 devices and eight ASCII devices, the company said. Pricing ranges from \$6,500 to \$8,155.

The vendor is also offering two smaller models, the 91R and 92R, designed to connect as many as eight terminals and workstations to an IBM Systems Network Architecture network. They are priced at \$3,855.

**IBM**  
1133 Westchester Ave.  
White Plains, N.Y. 10604  
914-642-3000

Digital Communications Associates, Inc. (DCA) has enhanced its E78 Plus and Windowlink for Imsa software packages. E78 Plus now includes E78 Lite, an entry-level package for personal computer-to-mainframe communications; a new keyboard monitor; and new display capabilities, the company said. The product is priced at \$395.

Windowlink, an IBM 3270 emulator for use with Microsoft Corp.'s Windows, now features support for DCA's PC-remote FT/3270 file transfer software and IBM's mainframe-based 3270 PC file transfer program.

In addition, Windowlink now supports DCA's application programming interfaces for IBM's Server Resource Programmer Interface and Professional Office System software. Windowlink is also priced at \$395.

**DCA**  
1000 Aldersgate Drive  
Alpharetta, Ga. 30201  
800-241-4762

A handheld device that reportedly allows users to call in to a host computer from any location in the world has been announced by Lee Mah Datacom Security Corp.

Called Infokey, the product provides security by designating "legal" callers to the host, according to the company. The unit was designed to operate with the vendor's Trinet 2000 systems and will interface to any external or internal modem through standard telephone jacks. Infokey costs \$150.

**Lee Mah Datacom Security**  
3948 Treat St.

**NYNEX**

## Electronic mail

Tita, Inc. has announced the addition of X.400 software to its Twice family of Open Systems Interconnect (OSI) data communications protocol products.

Twice X.400 provides message handling services as specified by the X.400 recommendations for electronic mail and supports the major U.S. and international networking standard profiles, including Government Open Systems Interconnect Profile. Royalty-bearing and royalty-free software licenses start at \$60,000.

**Tita**

24301 Southland Drive  
Hayward, Calif. 94545  
415-785-5970

## Network management

Codex Corp. has introduced Release 2 of its 9800 Network Management System.

The product was designed to integrate management for the vendor's entire line of systems modems and statistical multiplexers, and the latest release reportedly allows users to manage Codex 2600 series leased-line modems as well.

The system consists of hardware, software and network services, with the software running on the Apollo Computer, Inc. Domain workstation platform, according to the company.

Pricing starts at \$50,000 and is said by the company to include design, software subscription, installation, configuration,

training and maintenance.

**Codex**  
20 Cahet Blvd.  
Manfield, Mass. 02048  
617-364-3000

A personal computer-based, centralized management system designed to remotely monitor and configure dial-up modems has been announced by Universal Data Systems.

The Globalview mouse-driven system allows communications managers to monitor and configure any local or remote device and is ideal for applications in which information flows to or from a central site, the company said.

The product reportedly consists of an Intel Corp. 80286-based Personal Com-

puter AT controller, custom Microsoft Corp. Windows-based network management software, a 20-Mbyte hard disk and a series of equipment racks that can support up to 512 devices per controller via an RS-422 interface.

Additional features include password and security protection, and up to 16 racks may be supported per controller. The company also plans to offer support for IBM's Netview/PC.

The Globalview base system includes a 2,400 bit/sec. dual-modem and one data shelf. It is priced at \$6,600. Delivery is scheduled for the third quarter.

**Universal Data Systems**  
5000 Bradford St.  
Huntsville, Ala. 35805  
358-721-8000

Comptron, Inc. in the Netherlands has introduced a management software product that drives a complete IEEE-488 interface, the company said.

The network is implemented in the OC-91 VME-GPIB computer module of the vendor's VME bus system. The IEEE-488 management software runs with the OS-9/68000, /68020 and /68030 operating systems, Version 2.2, and supports controller, talker and listener functions, the vendor said. It is priced at \$975 with OS-9 drivers priced separately.

**Comptron**  
Netherlands Consulate General  
Economic Section 2a-88  
One Rockefeller Plaza  
New York, N.Y. 10020  
212-246-1429

A software package that reportedly saves 90% of the time spent on most common system management tasks for Sun Microsystems, Inc. workstations is now available from Pathless Technology, Inc.

According to the vendor, Gurutape complies with Unix networking standards and was designed specifically for network-based network management. The mouse-driven program reportedly provides file backup and storage; terminal and peripheral configuration and control; user account and group maintenance; and system control functions.

Gurutape is priced at \$995, and a stand-alone version is available at \$895, the vendor said.

**Pathless Technology**  
100 E. Washington St.  
Syracuse, N.Y. 13202  
315-422-2224

Fibronics International, Inc. has released an enhanced version of its network management software for the Fibronics Advanced Cabling Systems (FACS).

The FACS Network Management Software 2.0 monitors more than 30,000 terminals in any single network, according to the company. The software reportedly uses an IBM Personal Computer as a dedicated management station and is targeted toward large on-premises installations and multibuilding campus environments. Hardware requirements include Fibronics' SFS 8742 Controller and an NMS FM 8742 Buffer for installations with more than 16 Fibronics Universal Multiplexers, the company said.

FACS NMS Version 2.0 is priced at \$495.

**Fibronics International**

## INTRODUCING GANDALF'S NEW 19.2 KBPS METRO MODEM.

When your run is within 200 miles (300km), why spend the money for a 128 Kbps long-haul modem? Gandalf's new LDM192 metro modem gets you there for much less.

Besides the low price, the LDM192 cuts operating costs too, running on 4-wire leased lines. And, it supports synchronous and asynchronous communication in point-to-

point configurations, including multiplexer backbones and Front-End Processor to Cluster Controller applications.

Our low cost still buys you the most advanced digital signal processing, plus auto-equalization for easy installation. A rackmount model is also available.

So speed up your metro communications while keeping

costs under control with Gandalf's new LDM192 metro modem.

# MANAGER'S JOURNAL

## EXECUTIVE TRACK

**Carroll R. Franklin** has been named vice-president of the planning and management information department at General Employees Insurance Co. (GEICO) in Washington, D.C.

Franklin was promoted from assistant vice-president of planning and management information. His previous positions at GEICO included planning and analysis director and cost-benefit administrator.

Franklin joined the firm in 1978 after retiring from 22 years in the U.S. Marine Corps as a lieutenant colonel. He holds master's degrees from the University of Rochester and George Washington University and a bachelor's degree from the U.S. Naval Academy.

**Blue Cross & Blue Shield of Ohio** in Beachwood, Ohio, announced three appointments. Frank Gihia was named manager of technical support for the Eastern and Western divisions. He has more than 15 years of experience managing technical support functions at Argo-Tech, Transocean Savings Bank, Gould Ocean Systems, Johnson & Johnson and Curtis Industries.

Andrew J. Balassa was named director of computer centers. A five-year veteran of the firm, he was previously manager of the Beachwood data center. His replacement in that post is Thomas Hearn, who has 12 years of experience in data center operations.

## Building systems to last at Met Life

Cavanagh's career spans the computer evolution, from flat files to DB2

BY ROBERT MORAN  
CW STAFF

**D**aniel J. Cavanagh's 32-year career is part of Metropolitan Life Insurance Co.'s computing infrastructure. The company's information systems organization has his mark throughout, because he lived the backroom procedures and business operations that he later automated with IS.

Although the databases of the systems have evolved from flat files to IBM's DB2 and the balance of use has shifted from batch to on-line, the systems are essentially the same today as they were when Cavanagh became their chief architect in the early 1970s.

"We have had to reengineer some of the systems and change the way in which they function, but we haven't changed them dramatically, and they are essentially the same systems I built," Cavanagh says.

That is a rare display of pride for the reserved Cavanagh, who started with the company in October 1957 as an insurance trainee in its industrial insurance department. He progressed for 14 years through various positions in the company's back offices until he became a manager in electronic project development in 1972. He was promoted to his current position of senior vice-president of IS in 1983.

### Spoils fly

Cavanagh entered the information systems field after doing graduate work in 1966 and 1967 at Baruch College in New York. Classmates who were working with computers in their own companies sparked his enthusiasm, he said.

## Corporate culture key to IS success

BY CLINTON WILDER  
CW STAFF

**I**t's not just a package. It's their corporate culture.

The secret to Federal Express Corp., a leading-edge user of technology for marketplace advantage is a corporate philosophy that encourages creativity, tolerates failure, promises full employment and focuses on the single goal of 100% on-time delivery. The philosophy comes from the top — Chairman Fred Smith.

"We have a [technology] champion who happens to be chairman of the board," said Chris Demos, a Federal Express senior business adviser for strategic integrated systems, during a recent conference of information systems executives at Babson College's Center for Information Management Studies in Wellesley, Mass.

## PROFILE: Daniel J. Cavanagh

**POSITION:** Senior vice-president of IS, Metropolitan Life Insurance Co.  
**MISIÓN:** To build the expertise and cost advantages associated with expert and imaging systems

"Dan has worked in the back rooms over the years, and he knows the fundamentals of the business," says Donald Odell, the executive vice-president to whom Cavanagh reports. "He isn't an information systems type who lives up in the clouds — he can see how this fits together."

Cavanagh, however, is physically up in the clouds about five days a month, flying to conferences, vendor meetings, internal customer sites or the

New York-based company's data centers in other states. Cavanagh says that he prefers "to hear firsthand what is going on and to meet other people."

Although 20% of Cavanagh's time is now spent honing up on the technology, he dedicates the lion's share to keeping pace with the problems and progress of about 1,000 employees. Eight or more employees from the same level of the IS organization meet

*Continued on page 66*

tracking information for its customers. "We strongly believe that information about the movement of the package is as important as the package itself," Demos said. Federal Express guarantees that customers must receive tracking data within 30 minutes

of requesting it, or the delivery is free.

Applications developers — for six weeks at a time — are fully immersed in the business they are supporting. The menu prompts on Federal Express' Super-tracker handheld scanners were designed by couriers, not software engineers. "It speaks in courier-ese, not tech-ese," Demos said. "To us, software quality means not just debugging but ensuring that it does what the user wants."

What's next in the Federal Express technology arena? Demos said the firm is researching improved graphic displays of route maps and expert systems to advise operations personnel of the best recovery scenarios after equipment breakdowns or weather delays. "We're trying to be more proactive, to go beyond information-gathering to process control," he said.

# Why the most productive toolset for Rdb™ and Oracle™ databases comes from Cullinet.

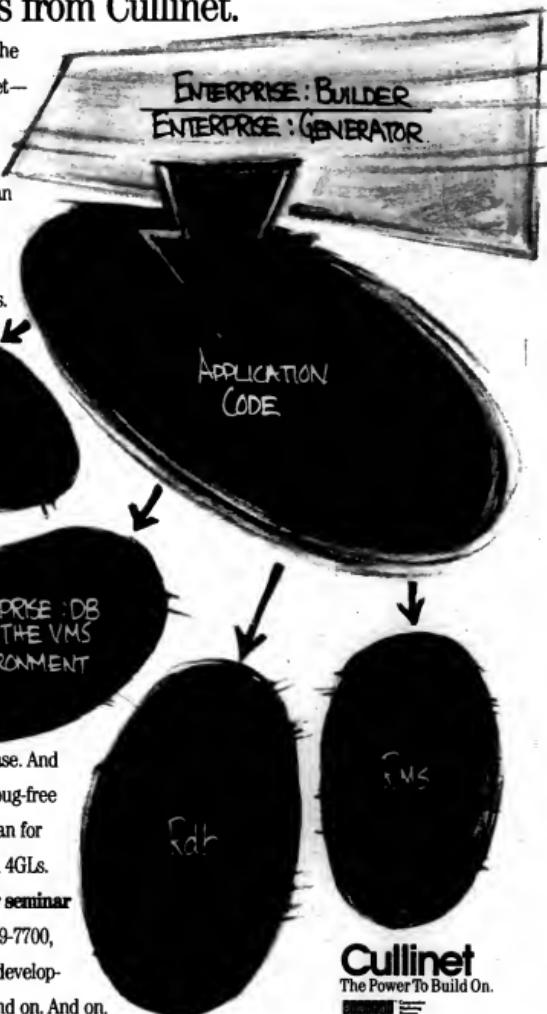

It's the development toolset for the VAX™ environment from Cullinet—Enterprise:Builder™ and Enterprise:Generator™. A toolset so powerful, it gives you an amazing **30:1 productivity advantage** over 3GL toolsets.

Plus a **10:1 advantage** over 4GLs.

As if that weren't enough, Enterprise:Generator also gives you the vendor independence you need to develop applications for any platform, independent of hardware, operating system,

programming language or database. And you can automatically generate bug-free code in Cobol, C, BASIC or Fortran for applications that will outperform 4GLs.

So, call 1-800-551-4555 now for seminar information. (In MA, call 617-329-7700, Ext. 2135.) Then get ready for a development toolset you can build on. And on. And on.

**Cullinet**  
The Power To Build On.

\*Enterprise:Builder and Enterprise:Generator are trademarks of Cullinet Software, Inc. Rdb, DB2, VMS and VAX are trademarks of Digital Equipment Corporation. Oracle is a trademark of Oracle Corporation. IBM, Cullinet Software, Inc.

## See the industry's most productive VAX toolset at the Cullinet Seminar nearest you.

Attend this new Cullinet seminar, and in just two hours, you'll see for yourself how easily you can build production applications on the Enterprise:Builder and Enterprise:Generator toolset. It's a small investment in time that will change your company's programming power forever.

**Take home a free demonstration toolkit.** All you have to do is attend the seminar nearest you, and you'll receive a free, single-user, runtime copy of Enterprise:Generator and Enterprise:Builder complete with documentation and video tutorial. So don't miss out! Call us toll free, and make your reservation today.

The Power To Build On.

# From mainframe to PC

Borg Warner's forced downsizing cuts IS budget in half

BY ELLIS BOOKER  
CW STAFF

CHICAGO — Don't tell Leonard Murrell and Steve Derry about "corporate consolidation." The pair have lived this phrase for the past 14 months, transferring Borg Warner Corp.'s information systems operation from an IBM 4341 mainframe to a personal computer-based local-area network.

In July 1987, Borg Warner was the object of a takeover attempt and as a protective strategy went private in a leveraged buyout. Later, to manage the resulting \$4.5 billion debt load, the firm sold four of its six business units, leaving two remaining groups — Borg Warner Automotive, a half-century-old automotive parts business, and Borg Warner Protective Services, the largest armed car and security guard operation in the U.S.

The impact on IS at the Chicago corporate headquarters was immediate. The MIS director was let go and not replaced, and two of his four managers followed. IS staff contractions continue at Borg Warner, matching the reduction in the headquarters staff, which has shrunk from 235 people five years ago to just under 100 today. The IS department now claims seven full-time employees.

Murrell and Derry confronted this environment head-on when they walked into the office of the controller of the corporation in January 1988. The controller issued the following directive: Cut the IS budget — there's \$1 million but historically around \$1.5 million a year — to \$500,000.

The two were given just seven weeks to devise a plan, which had to be put into effect by the end of the year.

"The off-the-wall part was to keep it a secret," said Murrell, manager of systems and programming. "But the only possible way was to get everyone [in the department] involved." So Murrell and

Derry, the manager of technical support, brought the nine remaining employees into a room and explained the situation.

At the heart of the cost-savings was dismantling the firm's IBM 4341 at its Des Plaines, Ill., computing center. The mainframe was linked via a 56K bit/sec. dedicated line to a 90-station CRT network at headquarters on Chicago's Michigan Avenue. The processor had been moved to the suburbs in October 1985 to avoid a costly air-conditioning system upgrade at the downtown computer center.

 **BorgWarner**

"The IBM rep's solution was a System/38," Murrell said. But that mainframe would have to be replaced and maintained, he noted, and the maintenance costs put in. Second, applications from the mainframe would have to migrate from the 4341's DOS/VSE to the System/38's CP/T operating system.

Before their seven-week clock began ticking, Murrell and Derry had a "brainstorming" session in which they considered many alternatives to the 4341, including LANs. But could they move the applications over?

Although they had no experience with LANs, they did have some familiarity with PCs. Prior to the buyout they had replaced 100 typewriters in headquarters with IBM Personal Computers XT's equipped with board cards and connected via 3274 converters to the suburban computer center. "In the end, we allocated \$260,000 and decided a LAN was the way to go," Murrell said. The two elected to put in a Novell, Inc. network and use two Novell 386 servers, one for the accounting department and one for the human resources department.

The human resources department had run two sorts of applications on the mainframe across the water

frame: a corporatewide investment plan for 401K tax reports, and a "people database" for tracking pension plans and other data for Borg Warner's 70,000 employees.

### User-friendly choice

The IS staff, which prepared the tax forms and managed the people database, was the "user" in this case and so got a chance to vote on applications software. The group selected Ashton-Tate Corp.'s DBase, a choice Derry said he believes was made out of an instinct for survival. "They wanted a package that was marketable elsewhere," he said.

Both Murrell and Derry like the flexibility of the LAN and say their accounting department users appreciate the friendliness of the general ledger program. All the software is up and running, and a cautious, small-scale test of DBase IV is under way.

Meanwhile, the automotive and protective services division, headquartered in Troy, Mich., in Farmington Hills, N.J., recently had its own LAN built, and so their connection to Chicago headquarters and its new LAN is, if anything, easier to manage. Both divisions transmit their monthly, quarterly and annual financial data to Chicago via dial-up lines. Both still rely on the 3270 protocol emulation software they used during the time of the 4341.

On the downside, however, both men long for the support they enjoyed from their IBM representative. Disatisfied with his original LAN dealer, Murrell recently switched to another Chicago-based firm. The experience prompted him to offer the following advice: "Find someone big enough to handle problems, and take your time. Last year we did everything in a hurry."

Although Derry said moving the applications from the 4341 "pushed the budget to the limit," he found the experience enlightening. Indeed, he suspects other mainframe shops might benefit from a LAN conversion, if only they would consider the possibility. "I think some shops are keeping their host out of force of habit," he said.

## Foreign and U.S. execs see eye-to-eye on top IS issues

BY CLINTON WILDER  
CW STAFF

WELLESLEY, Mass. — Overseas information systems executives share more of the views of their U.S. colleagues on the top issues in IS, according to a recent survey conducted by Babson College's Center for Information Studies.

When asked to rate 18 issues in order of importance, 50 U.S. executives and 29 foreigners, mainly Europeans, chose the same top five issues, although in different order. To U.S. executives, the No. 1 issue was "rapport" or credibility with senior management. The issue with the most difference between first and second place was "strategic planning," which was rated as the top priority by Babson Consulting Survey earlier this year. Senior management reported ranked second as a concern for non-U.S. executives behind "ability to recognize and exploit strategic systems opportunities."

Further down the list, however, there

were notable differences between the opinions of foreigners and Americans. "Employment of effective application development procedures" garnered eighth place on the U.S. list, but only 12th on the overseas ranking.

When the survey was presented to IS executives at a recent conference here, one observer noted the apparent paradox between the foreigners' No. 1 ranking for strategic systems and the low priority for application development methods. "It's not applications development" that is so important, reported Stewart Wilson, head of research at RBC-Royce Ltd. "It's defining what management develops."

Another notable difference was the placement of "availability of a tested security/backup plan," which was ranked sixth by non-U.S. executives but only 12th by Americans. One American sug-

CW CHART

gested that the discrepancy was due to the relatively low level of terrorist activity in the U.S. compared with Europe.

A Swiss executive recommended that it is reasonable for a company to consider alternative, at least in its core, that makes an IS backup plan more imperative. Americans ranked "cost control and containment" 10th, compared with 14th on the non-U.S. list.

## Met Life

FROM PAGE 61

with Cavanagh in impromptu coffee kitches to discuss what is on their minds — and has.

Whether the employees are from the lower rungs of the corporate ladder or are those who work closest to him, "they respect him but aren't intimidated

by him," says Al Giordano, vice-president of IS, who reports to Cavanagh. "He has the ability to get employees at all levels to feel relaxed and open up and ask him questions."

In part, the relaxed response comes from Cavanagh's evident confidence in his people. Indeed, when Cavanagh took over his position in 1983, he reduced the chain of command, placing confi-

dence where he thinks it belongs — in his line managers.

"I wanted as few levels as possible between project managers and myself," Cavanagh says.

"By pushing down decision making, things happen faster. The line managers have been developed and trained and are going to make the right decisions."

Cavanagh gives his employees leeway but within limits.

"You are on your own as long as you know when to get back to him," Giordano says. "As long as you reach your goal, you don't have to do it this way."

But Cavanagh, it seems, expects no less from his line managers than he does from himself. "I send him a lot of things and he never lets them drop," Odell says. "He comes back promptly and has the ability to take con-

**H**E ISN'T an information systems type who lives up in the clouds — he can see how this fits together."

DONALD ODELL  
METROPOLITAN LIFE

pics issues and relate them in graspable terms."

Cavanagh has proved repeatedly that he gets things done, even in the most difficult circumstances. In 1973, when Metropolitan Life added casualty insurance to its offerings, Cavanagh was charged with providing the electronic support for the new business — a difficult task that was compounded by the clash of corporate cultures and the desire of the new division to maintain its autonomy.

"Dan assessed the situation quickly and under difficult circumstances," Giordano says. "He quickly recognized that we had to have a system from outside and didn't let the politics get in the way of meeting our goals and getting into business."

Those skills have netted Cavanagh special assignments from top executives. "His ability to work across department lines — with people who can be difficult — is one of his greatest qualities," Odell says.

Those abilities will serve Cavanagh in his next quest: to build the expertise and the cost advantages associated with both expert systems and imaging systems, two technologies he believes will lower response times and raise service levels. "Expert systems and imaging will radically change the office environment," he says. "I would like to see that platform in place before moving into something else."

## TOP NEWS

Cavanagh, 49, and his wife live in Brooklyn, N.Y., and both are avid golfers. His four children now live away from home. Two are in the computing business — a daughter who is a program/analyst and a son who is an IBM employee.

Cavanagh is aware that betting on a technology involves chance, change and the possibility of failure.

"We went out on a limb with a few projects," he says. "We thought, for example, interactive video would take off, and it hasn't."

There have been others, and Cavanagh said that he has learned from them and is undaunted by change. "We've changed several times," he says. "Every time we've changed, the company has gotten better for it. We've moved forward, and we shouldn't be afraid of it."

## The Right Answer: 3270 Emulation at Half the Price.

### MultiCom3270 Terminal Emulation System for IBM® and compatible Personal Computers

Are you put off by the high cost of 3270 terminal emulators? If so, view Multi-Tech's new MultiCom3270 IRMA-compatible Terminal Emulation System is the Right Answer for you.

**MultiCom3270** consists of a coaxial 3278/79 terminal emulation card and our **MultiCom3270** plus file transfer software, in versions for both PC/XT/AT computers and the IBM Micro Channel Personal System/2. It lets your PC communicate through a cluster controller directly with your IBM mainframe computer.

So why go with our **MultiCom3270** instead of "Brand I"? The Right Answer is price. At \$699 suggested retail (including both hardware and software), the **MultiCom3270** is about half the cost of an IRMA board and software. That's a cost savings that can really add up!

But price isn't the only thing. **MultiCom3270** is both IRMA compatible and easy to use. Session operations are handled by simple keystrokes, with pulldown windows and online help information. You also get keyboard record-playback and keyboard lock, which enhance the speed and security of your system.

For a 3270 terminal emulator that delivers the best combination of features and reliability at half the cost, **MultiCom3270** is clearly the Right Answer.

## TAKING CHARGE

*Jeff Rocklin*

### A big MIStake

I once worked as a programmer/analyst at a modest-size company. It was a good shop to work in if you had a passion for what you did and an ability to police your own work. Management took a hands-off attitude in running the department.

At the time I came aboard, this policy worked fine because the tasks were challenging and plentiful. About 10 months later, after completing the outstanding major projects, the work ran out. It didn't take much time after that for the department to fall apart. Paradise lost!

I have found this problem to be a common one throughout most of my 10 years of experience in MIS. In most companies, the responsibility of MIS falls under the supervision of former programmer/analysts without any background in managing people. Often they have been rewarded for having done good work keeping the machines alive and then been promoted right out of what they do best. Frankly, they are usually not up to the task of running a computer shop.

I'm not talking about a lack of experience or knowledge. The simple truth is that computer people, generally speaking, make lousy managers. Computer people have egos the size of the great outdoors (myself included), and speaking from my experience as director of data processing at a small shop in New York, our egos make us impossible to manage.

It's an understandable phenomenon. Computers have revolutionized in a very short time the way the world functions. Today, computers are everywhere, and it has been a real ego-booster experience. The world cannot survive without computers, and computers cannot survive without programmer/analysts making them dance.

If management works effectively, slow periods in an MIS shop become highly productive. This is when the seeds of new ideas are nurtured — a time when the company gets to take advantage of creative minds without pressure of deadlines. People are free to brainstorm and build better systems.

But when management is ineffective, a period of stagnation results. The staff becomes bored and begins to look elsewhere for new challenges. Self-motivation doesn't create new work, but it serves as the fuel that gets the work done on time and within budget. It is the responsibility of management to create new work by assigning tasks and setting a course of action. Without direction, self-motivation dies.

Management is the art of delegating responsibility. With a staff of big egos, delegation can be a tricky prospect that requires an MIS director to be a salesperson, a technical genius and a diplomat. If he is doing it right, all ideas have value because brainstorming promotes a sense of contribution among the staff.

Back to my tale. After a few months of very damaging stagnation, the vice-president decided to hire a director of

MIS to put the department back on track — a very sound business decision. The person they brought in fit the needs of the company from an MIS standpoint. He had some experience as a consultant and a knowledge of computer systems.

Unfortunately, he did nothing to encourage the sharing of ideas in the department. A self-sufficient man, he had strength and leadership, but self-confidence with a closed mind is arrogance. It took him less than a week to alienate his already discouraged staff, creating a deeper rift in the department. Ultimately, a loyal and talented group of people moved on to other jobs.

If there is a moral to the story, it is this: When hiring a manager for an MIS department, technical ability is not the

**I**T IS THE responsibility of management to create new work by assigning tasks and setting a course of action. Without direction, self-motivation dies.

most important skill to look for. Employees will demand more than 40 hours per week at their job, and most of them wind up taking the job home at night. Employees need a sense of value, belonging and purpose to have a feeling of self-worth. Without feeling part of a team, those 40 hours are long and hard to handle.

I'm no authority on how things are supposed to be, but I've watched some fine MIS centers dissolve because the people managing them can't seem to

work as well with the employees as they do with the hardware.

We have to look more for the human qualities in our managers. Technical knowledge is an easy commodity to obtain. It comes with experience. Maybe it's time we started looking for managers who manage people as people and not as machines.

Rocklin is an independent consultant currently working in the Los Angeles area.

## CALENDAR

"The Intelligent Corporation" will be the focus of a two-day seminar June 5-6 in New York. The program, based on the book by Ruth Staats, is targeted at chief information officers, heads of information systems, company presidents and strategic planners. Some topics include "Foreign Competitive Intelligence Tracking Systems," "How to Use and Get Strategic Information" and "Strategic Technologies of the '90s." Speakers will represent Eastman Kodak Co., AT&T, Bankers Trust, General Foods Corp., Digital Equipment Corp., Pitney Bowes and others. For more information, contact the Ruth Staats Forum, Inc., Suite 1301, 404 Park Ave., South, New York, NY 10016.

For an educational institution, nothing is more important than the smooth exchange of information. That's why many colleges are making information networking a top priority.

The toughest challenge is connectivity. Colleges and universities, like most places, acquire computers and telecommunications hardware in patchwork fashion, ending up with little or no compatibility.

For our northeast college, AT&T Network Systems, working with the local telephone company, demonstrated that ISDN will do the solution. Their information services manager explained: "ISDN gave us the best capabilities for the least cost. And we didn't have to trash our existing systems."

With central office-based ISDN, ordinary phone lines become the links in a fully interactive network. This translates into many applications and benefits. Voice and data can be transmitted simultaneously. For example, students and professors can confer with the Dean, who has on-line access to student records. Electronic mail streamlines internal communication, so course enrollment changes can be posted immediately. PC-terminal access to host computers and electronic file transfer extend every user's access to sophisticated software and multiple databases.

As the college's IS manager puts it: "ISDN can revolutionize the education experience. It's going to make us a better college. And, bottom line, a more competitive college."

# EXECUTIVE REPORT

DISTRIBUTION OF RESOURCES

RESTRUCTURING  
OF MIS

## Sharing the wealth: Data becomes community property

BY MICHAEL SULLIVAN-TRAINOR

# B

y 1994, business executives starting work at Imperial Corporation of America (ICA) will face a challenging question: "How much application development do you want to do?"

Facing the need to develop unique products and services in the competitive financial services industry, Milton G. Wetzel, ICA's executive vice-president of the Information Systems Group, is planning to turn more systems initiation, design and programming over to the San Diego-based bank holding company's 25 business units.

"In five years, I see us giving the client as much of the development responsibility as he is willing to accept. We will provide the environment and the standards," Wetzel says.

To lay the groundwork for this strategy, Wetzel encourages ICA business managers to hire technical analysts with business experience from outside the company to work with MIS in identifying applications and assisting with design. He also offers executives a choice between building their own separate personal computer-based applications or working with MIS to implement new host-based systems.

By sharing application development responsibility, Wetzel is moving the creation of systems closer to those most knowledgeable about business requirements. He is also giving the business units a sense of ownership over their computing systems.

ICA's MIS staff still designs most of the business unit applications, working with the unit analysts to define requirements. But in the future, the central staff will leave a lot more of the development to the front-line analysts, in many cases, providing only guidance on standards and protocols.

Even though the strategy is

MILTON WETZEL/IMPERIAL CORPORATION

**ICA's Wetzel encourages dividing the responsibility for systems**

only in the initial stages of implementation, there have been measurable efficiency gains. During the past three years, staffing in the MIS group has remained constant at 198, but 14 major applications have been installed and a conversion from DOS/VSE to MVS/XA has been completed.

Structural shifts such as Wetzel's strategy broaden the definition of distributing resources. Once thought of as an expanded data access or distributed processing, distributing resources today means providing information systems support to users wherever they are and in whatever form they need it.

Whereas in-house users will require information support will change greatly as corporations advance into the 1990s. Many

companies are anticipating a demand in which the pace of communication will set new records. New organizational structures will be required to allow them to operate in a more dynamic and entrepreneurial way. Companies will be looking to their information systems organizations to supply them with the appropriately configured information supply lines.

What is needed, according to the Lexington, Mass.-based consulting firm Nolan Norton & Co., is a new structure — one that allows knowledge and information to be manipulated, created, stored and communicated both rapidly and inexpensively. This structure, described by Richard L. Nolan, Alex Pollock and James F. West, in a research paper titled "Creating the 21st Century Organization," will result in

something they call a "network organization."

Distributing information resources will be essential in this new organization. However, being prepared for the future is not the only factor driving MIS managers to distribute resources today. There are three major trends spurring business in this direction:

- What constitutes "need-to-know" information for business users is changing. Managers and workers at many levels in many departments now need the ability to manipulate and analyze data in diverse functions of the company and in remote locations.

- MIS is striving to develop the most cost-effective systems. Often this goal is best accomplished by running distributed applications on a PC network. The cost per million instructions per second on a central mainframe is about \$200,000, while it is only about \$4,000 on a PC.

- The availability of robust, distributed technologies — database management systems and networks — is raising interest in nontraditional systems and applications in both the MIS and user camp.

Some experts speculate that these trends will lead control of systems away from MIS and toward users, ultimately disempowering MIS. But others argue that the more users become involved with systems acquisition, development, the more they will need MIS to link disparate systems and provide direction on standards and strategy.

While the experts argue these points, managers are being forced to distribute decisions on other factors than simply who has control over what.

"There's no value in distributing for the sake of distributing," says Raymond S. Perry, vice-president of information services at Avon Products, Inc., in Rye, N.Y. "You make business decisions based on what pays off. While we're distributing for reasons of cost and high response, we're looking at centralizing some of the things that are in

### INSIDE

#### A different kind of customer handshake

Page 80

#### IS staffs begin journey of migration

Page 84

Sullivan-Trainor is Computerworld's senior editor of special projects.

## Sharing

FROM PREVIOUS PAGE

our branches now."

Nevertheless, as users acquire more and more functional terminals, such as high-powered PCs and local area networks, new expectations are raised about their part in information systems development and implementation.

"Whether MIS is responsible for it or not, information resources are being distributed, and enabling technology is playing an important role in driving it," says Bill Rosser, vice-president and director of industry services at Gartner Group, Inc.

### Small dealers demand

With the advent of electronic mail, users recognized the power of instant communications throughout the company. This understanding blossomed into demand for networks to link file and communication servers, Rosser says. File servers allowed data to be shared in work groups and communication servers allowed access and manipulation of corporate data using PC functionality. "The next stage is departmental and work group applications in PC-based systems," he predicts.

Applications at the departmental level trigger MIS involvement because of concerns about corporate security and compatibility.

On the corporate level, MIS managers are also concerned about distributing access to information generated by the company's total applications portfolio. They are designing cross-functional systems to meet needs. For example, many banks are designing systems that allow a clerk to view information about all of a customer's accounts even though that data is in numerous separate applications.

Corporate demands for cross-functional systems combined with sophisticated departmental users operating applications on disparate platforms will lead to platform-independent applications in the 1990s, Rosser contends. These applications will run on different-scale platforms from multiple vendors with common data structures.

For all the promise of the future, MIS currently lacks the technical resources to implement a truly distributed enterprise-wide network of heterogeneous systems.

Corporate distribution systems are lessons because there is little synchronization or coordination of data to guarantee accurate updates and changes to corporate databases.

Managers must design new systems architectures that incorporate departmental systems and corporatewide central and distributed systems. Their job will become easier with the ad-

vent of vendor-driven standards such as IBM's Systems Application Architecture (SAA) and Digital Equipment Corp.'s Applications Integration Architecture.

Eventually, interfaces will be available from vendors that connect different systems and different system architectures such as SAA, but in the meantime, MIS must design tactical solutions that serve today's requirements.

"The array of new client-server models and data access applications will coexist with the old layer of central applications, and we will transition ourselves application by application to a new world of distributed resources," Rosser says.

Forming the basis of this transformation will be new structures within MIS and the departments it serves. But to get there, MIS has to overcome several problems.

For example, enlisting our own analysts was a significant cultural change for ICA's board of directors, but one that took a great deal of relationship-building on the part of MIS.

"We had to change what users thought of as the data center and establish credibility as professionals," Rosser reports.

MIS accomplished this task in about 12 months by successfully executing new high-visibility systems. The systems included a check processing center, a general ledger and financial accounting system and a human resource/payroll system. The efficient implementation of these systems established credibility for Rosser's group.

This credibility made it easier for the business unit managers to feel comfortable about working in close partnership with MIS through unit-hired analysts.

"There are always people

who are skeptical of change, even if it's favorable change," Rosser says. "We had to show them that we were people who could be trusted to deliver what we said we would deliver."

Department managers were also attracted to the idea of increased input in the systems design process. "When we got here there wasn't anybody on the client side doing anything," he says. "I was a clean dissatisfaction with MIS, I'd jump at the chance to have control over my own destiny."

Some of ICA's business units are still reluctant to move in the direction of autonomy. For the majority that have, however, Rosser says the payoff has been the development of strategic applications that might never have materialized otherwise. For example, a loan-modification module was added to the company's real estate applications to help manage customer investments.

The hedging system may be the one exception to this rule, Rosser says. "And it could not have been created if we didn't have people in finance that were computer literate."

### DEC doesn't worry

Unlike ICA, Digital Equipment Corp., the second largest systems vendor in the U.S., does not have to worry about whether people on the business side understand technology. In DEC's case, an internal resource distribution strategy has led to organizational changes of a different nature. The focus of information resource distribution at DEC is a data network of 35,000 systems in 33 countries. The network provides about 100,000 users with access to data, applications or processing power from any location worldwide.

## The challenges ahead

- MIS managers must develop architectures to bind distributed systems into a corporate network because standards such as IBM's Systems Application Architecture are still years away.

- To ease user concerns about organizational change caused by distributing resources, MIS managers must develop strong cooperative relationships with business executives.

- Traditional biases within MIS departments toward centralization must be overcome to implement distributed systems where they are the best solution.

- Workstation-level systems often lack the security and performance management functions of larger systems, forcing MIS managers to pay closer attention to those issues.

- Distributing access to corporate networks and databases to users outside the company raises serious questions of security and data ownership.

MICHAEL SULLIVAN-TRAINOR

Electronic mail and a host of other applications are available to users at 450 locations. Half the computers on the network are workstations or PCs, and the rest are nearly all medium- to large-scale DEC minicomputers — some configured in clusters — with a few Apple Computer, Inc. Macintoshes and couple of IBM Personal Computers, used for development only, though.

"Every element of DEC runs over the network," says Peter Brown, manager of technology at Digital Information Systems. The most pervasive application is order processing, which is used by most of the company's business units — from manufacturing to sales and service. Communications are managed worldwide across the network and rolled into single totals during reporting periods.

Although planning and testing began in the early 1970s, DEC's internal enterprise-wide network did not come into being until 1982. Computer systems have been added to the network at a rate of 50% a year, and the company has gradually moved to replace paper memos with electronic communications. The growth is moderating now as DEC's own growth slows, but applications will be added as required by business needs. Most of the new systems will be workstation and PCs.

The way network technology is applied is driven by DEC's organizational philosophy. "We have an organization that is aimed at building consensus among the employees and managers and the network enables that," Brown says.

This strategy has brought about changes within DEC, such as decentralized engineering. Hardware engineers develop CPUs in one location, software engineers design the operating systems in another, and direct-access storage device designers work elsewhere. The network ties these geographically dispersed work groups together in the creation of a single product.

"The network is an integral part of the way this happens. It has changed the way we do our jobs," Brown explains.

Likewise, the network facilitates the simultaneous manufacture and introduction of products in Europe and the U.S. In the past, there was often as much as a six-month gap between product introductions in one country and those in another.

The network also allows the firm to employ technical experts

## Forces for change in IS structure

**I**nformation systems organizations are facing a time of major transformation, according to the consulting firm DMR Group, Inc. in Toronto. Many are already shedding their traditional orientation as service organizations and creating new identities as bottom-line, competitive entities. The objective is to build a structure with the goals of the enterprise and to be both more responsive to competitive and strategic pressures and more cost-effective in delivering solutions to the business.

DMR has identified several of the trends that are increasing. By pushing IS executives in the direction of organisational restructuring, they include

the following:

- Corporate management's resolve to establish information systems strategies that will address strategic and competitive issues, which is leading executives to investigate alternatives to the traditional centralized IS infrastructure.

- Increasing competitive pressure, which has prompted widespread downsizing and cost-cutting across the organization and is forcing IS to consider the question of how to support the organization and deliver systems with fewer resources.

- New technologies are creating the perception that decentralized IS strategies are not only more responsive but more cost-effective. Although there is evidence that decentralization makes management of the technology and the organization more complex, the appeal of perceived savings is strong.

- IS executives are faced with the need to balance business unit requirements for innovation and flexibility with enterprise-wide requirements.

- IS organizations often suffer from an image problem and are viewed as technological dinosaurs, inhibited by individualists who do not understand how to relate to business units who are not responsive to them.

- End users, experienced with technology and conditioned by competitors' use of strategic information systems, are pushing to acquire greater power and exert greater control over information systems.

where they are most numerous rather than relocate them. For example, communications engineers in Reading, England, are a core part of the company's communications division based in Littleton, Mass.

"We have a high degree of flexibility and responsiveness," says Bob McCauley, DEC's corporate telecommunications manager. "We have the ability to tailor the operation to the local environment while still managing and coordinating those resources to get a better utilization of them for the total company."

Because the network facilitates a very flexible structure, it is not a style suited for all corporate cultures, Brown says. "You need people who are comfortable in that environment and feel they can still retain the right degree of control and coordination. At DEC, that's not very well, but at another organization you might not have the same amount of fluidity."

Technical challenges are the biggest obstacles for DEC's MIS. While the network allows distributed access, incorporating new technologies such as a complex structure is not easy. "How do you keep on top of the rate of technological change?" Brown asks. "How do you design an architecture that fits them all together?"

While searching for answers to these questions, DEC's MIS faces another problem — opening up the network to

outside companies such as DEC's distributors, suppliers, customers and development partners. The obstacles to the change are both technical and cultural. Security and expanding worker's boundaries are the main areas of concern, according to Brown.

Like DEC, IBM's internal MIS is grappling with working with outside users, but its approach to internal distribution of resources is as different as a VAX is from an IBM 3090.

Rather than one network of minicomputers and microcomputers, IBM's strategy is to establish multiple database repositories of information using large systems. These repositories act as a warehouse for data drawn from all the applications used by the company's business units worldwide.

#### Central source for data

"We are busy building those kind of repositories so that when any user wants to get information, he doesn't have to know each of the MIS applications," says Larry Ford, vice-president of IBM's Information and Telecommunications Systems. "All he has to know is that there is a central warehouse where the data exists."

The challenge of this strategy is to design interfaces that enable users to access and manipulate the data at the workstation level. MIS must understand how that data can be put in accessible form for the various users. Making that happen across

IBM's 120 MIS sites around the world requires a change in how IBM's systems personnel view their roles.

#### Special skills sought?

"Our MIS organization has tended to be a builder of new application," Ford says. "More and more to meet the internal needs, responsiveness is a higher priority. What we need is the kind of skills and thinking that comes if you are a systems integrator."

One of the chief difficulties of working with workstation-level applications is that they do not meet traditional MIS standards, says Steve Grant, director of Corporate Technology Planning at American Express Co. in New York. Grant advocates the use of distributed imaging systems within American Express' diverse operating units in different businesses throughout the country.

"You have to watch out for things you take for granted in a typical data processing organization," Grant says. "If you buy something for the host or minicomputer environment today, you get performance monitoring and tuning capabilities, transaction integrity and a whole host of things. In this workstation strategy, you have to be careful because these things are not considered," he explains.

Concerns about the difference between the large-systems environment and the PC or workstation level are causing managers to proceed cautiously with

distribution plans.

For example, at United Services Automobile Association (USA), a San Antonio, Texas-based insurance company, Donald R. Lasher, president of information services, plans to carry distributed access to data as far as he can, but he will not distribute the company's central DBMS.

"The complexity of breaking up the database and giving people pieces of it without it being easily correlated scares the bejeebers out of me," Lasher says.

However, in 1986, USA users will operate workstations running knowledge-base systems and accessing optical media. The company already operates an innovative companywide image processing application.

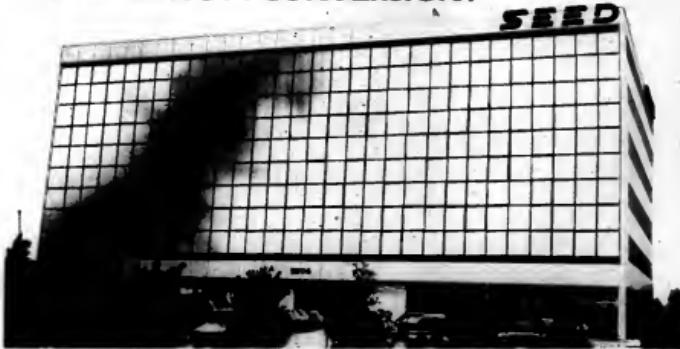

Customer service personnel will operate workstations that can access expert systems to help them offer financial services to policyholders. But they will only have access to the data they need to accomplish their applications. There will be a master database copy at a central site.

"No matter what the data element, there will only be one owner responsible for changing it and ensuring accuracy. That's the best way to keep things in sync, and it's bad enough doing it that way," Lasher says.

At Avco, central management of company information is also important. But Perry says he believes in moving the

## CONSIDERING A CONVERSION?

### MIGRATION MASTER™ FROM SEED. IT'S YOUR BEST RESPONSE TO CHANGING ENVIRONMENTS.

Migration Master from SEED Software Corporation is a unique application that simplifies the conversion of software between operating environments.

Consider the benefits Migration Master offers:

- Creates a functionally identical system.
- Reduces migration effort and elapsed time required to complete a software conversion.
- Automated and repeatable process, without "frosting" critical applications.
- Migration of all aspects of your application.

• Tool for software configuration management and documentation.

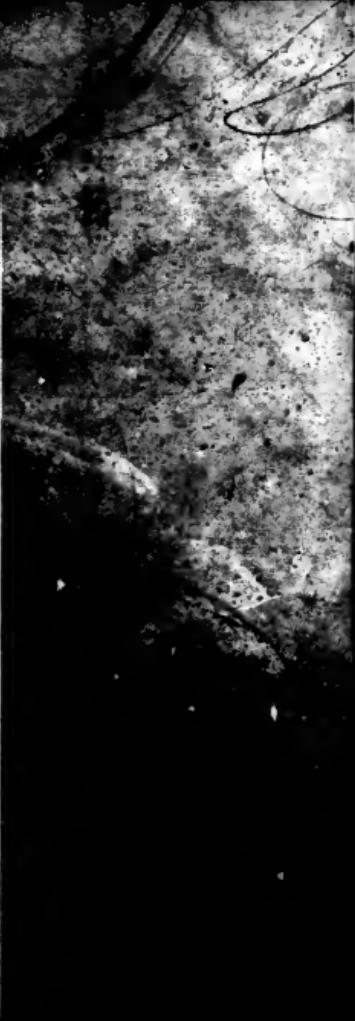

• Provides for coding standards enforcement.

When you consider all of the advantages Migration Master has to offer, we think you'll agree that Migration Master is the most cost effective way to convert your software.

If you would like more information about Migration Master, call Toll Free (800) 445-3267, in Virginia call (703) 950-8800. Or write for more information.

Your best response to changing environments.

# WHILE OTHERS WERE DEVELOPING THEIR UNIX SYSTEMS, WE DEVELOPED A FOLLOWING.

The NCR Tower® Family is the nation's bestselling line of multi-user commercial UNIX® systems.\*

We earned that market leadership by the leadership we displayed as a company in developing the commercial UNIX market. Right from the start.

While other major computer vendors tried to shore up their proprietary lock on the market, we saw that the market was turning to open systems.

We endorsed the UNIX operating system early. We enhanced it for the commercial market. With features like record and file-locking, Power Failure Recovery, Bad Block Handling, Error-Correcting Memory, and more. And now we have a solid eight years of experience supporting UNIX systems. More than just about any major computer company around.

We know our way around the chip architecture, too. After all, over the last eight years, we've been one of the world's largest consumers of Motorola 680xx chips.

We've also developed a following for our nit-picking fanatics and their dedication to quality. It's a commitment that starts with our engineering team that makes sure every part makes the right

processing out to distributed locations when that is more cost-effective.

Hottest item on the company's headquarters agenda worldwide financial reporting, payroll and manufacturing control for four plants. The CPU's are connected via a T1 network to five automated distribution centers, which are run by their own groups of DEC VAXes and IBM mainframes. Automatic picking machines, optical devices and conveyor belts process 50,000 orders per day with almost no human intervention.

"We implemented information technology in distribution for reasons of

throughput and expense savings," claims Thomas Weller, Avon's director of distribution development and support. "We need technology even more now to have flexibility and zero defects."

Perry says Avon's architecture is driven by MIS, which is not popular trend within MIS. "The important thing to remember is that our business is to make money by selling cosmetics; we make the computers suit the situation."

Information systems personnel at the distribution centers report to the business executives in charge of each site. But Perry retains functional responsibility for their activities. "I'm their godfather, as Tom [Weller] is the godfather of the distribution people," Perry explains.

The diversity of MIS approaches to

distributing resources make it hard for managers to learn from their peers.

Researchers are currently attempting to formulate theories about why certain strategies work. One such project is under way at MIT's Center for Coordination Sciences and Technology. The research is sponsored by Apple and other firms.

"We're asking if there are analogies between the ways people coordinate their actions and the ways computer processors can coordinate activities in a distributed network," says Professor Thomas W. Malone, director of the project.

While that work is under way, MIS managers will continue to go it alone, distributing resources based on their companies' needs, personal biases and the limitations of the available technology. \*

## How will IS help?

We are on the brink of a new era in information systems, according to the DMR Group, Inc. People throughout organizations are already using computers and communications systems for direct support in many of the aspects of their work. Computer systems are now extending outward to link enterprises with their suppliers, distributors and customers.

The next step will bring end users along to a point at which an integrated computer/communications system infrastructure will support all of an organization's internal and external information management needs.

As organizations move forward in the direction of integration, DMR suggests that they will divide the functional responsibilities of the information systems organization into four areas. These areas, as described in the firm's research report, "The Integration of Data, Text, Voice and Image," are as follows:

- Overall responsibility for driving the strategic use of information technology, including setting corporate policy. This function will be performed by a strategic planning team—an Office-of-the-CIO-type group. Ideally, this team will be a small cohesive team with executive responsibility.

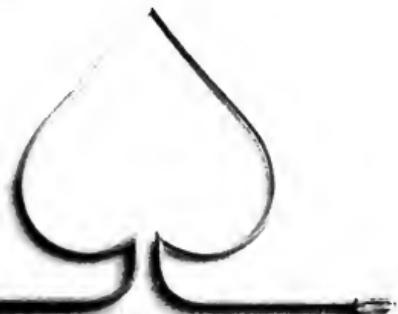

- Implementation and operation of the integrated computer/communications system. This utility-type function may be provided by the internal operations staff and/or by third parties such as facilities managers or systems integrators. Its services will be provided on a chargeback basis, and it will be operated as a competitive profit center.

- The development role. This function will become more distributed. User departments will take a lead in directing their own application systems projects. Development services will be provided by internal and external resources, mainly on a contracted basis.

- User consulting services. These services will encompass a broad range of skills and activities and will be provided by a combination of internal and external resources.

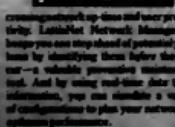

To some extent, this function may be distributed into user areas, but more common requirements such as technology-tracking functions should be part of a central pool of resources.

# WHY GAMBLE WITH NETWORK RELIABILITY?

## DEPEND ON LATTISNET NETWORK MANAGEMENT

When it comes to providing Ethernet networks, it's sometimes more like the cards you started against you. You need the right tools to provide the reliable service your customers expect from their networks—without having substantial investments in time, labor, and capital per server. And we can help you do just that with LattisNet Net-

work management software and user productivity. LattisNet Network Management helps you see ahead of potential problems by identifying them before they occur—a valuable preventive maintenance tool. And by using real-time data traffic information, you can monitor a variety of configurations to plan your network for optimum performance.

With LattisNet Network Management, you can manage your growing LattisNet network affordably—double utility—into the future. Call 800-524-1521, ext. 5000, or write: LattisNet, Dept. 400, 307 South Middlefield Road, Mountain View, California 94031. For more information, call 800-524-1521, ext. 5000.

all the quality, dependency and technological leadership you've come to expect from SysOptics. With over 150,000 nodes shipped to 500 customer sites worldwide, SysOptics is the leader in twisted pair Ethernet. And as a standards-based company, SysOptics designed LattisNet with a migration path to emerging and de facto standards.

So deal yourself a winning hand—rely on LattisNet Network Management.

To receive your free LattisNet® Network Management brochure and customized demo disk, call toll-free 800-524-1521, ext. 5000.

# You Should Be Able To Do Whatever You Want In Public Or In Private.

## Now You Can.

Introducing the MEGAMUX Transport Management System. The first T1 resource manager that lets you leverage the advantages of both public and private networks.

You no longer have to imagine what it would be like to have a true hybrid network. One that gives you the limitless interconnectivity of the public network, while maintaining private network control. Now, General DataComm gives you the power to do it.

The MEGAMUX Transport Management System (TMS) delivers true DACS compatibility at the DS-0 and DS-1 levels on both the channel and the aggregate sides. This allows you to configure or reconfigure individual channels while maintaining network management integrity within each specific bundle. So you get a lot more connectivity. And pay for a lot less bandwidth.

The MEGAMUX TMS lets you take advantage of Fractional T-1. Further, it will support the ISDN Primary Rate Interface. In short, this fully certified, public network compatible system gives you a guaranteed migration path to future service offerings.

---

### At Last, Quality-Based Network Management.

---

The MEGAMUX TMS sets a new standard for user control and flexibility. For example, channel profiles and aggregate parameters determine the optimum route. Characteristics such as delay, error rate, hop count, priority sequence and load balancing are utilized to complete the quality-based configuration.

The reliability provided by the MEGAMUX TMS includes Intelligent Automatic Retiming which supports dynamic channel timeslicing, pre-emption priority and network modeling. This maintains maximum applications availability during reconfiguration with the ability to review disaster scenarios off-line and test recovery strategies. Coupled with our MEGAVIEW® Integrated Network Management System, you can monitor your entire network from a single location. And you can do this end to end, whether public or private, so you're not just limited

to backbone management.

---

### A Company As Innovative As Its Products.

---

The MEGAMUX TMS is a central part of our carefully conceived and constructed Network Architecture. And, like all of our products, it was designed for worldwide operation with full product line compatibility.

There are many more advantages to the MEGAMUX TMS. That's why we've put together a networking guide, "How to Leverage Public and Private Networks." For a copy, or for more information, call 1-800-777-4005. The sooner you do, the sooner you can start doing what you want in public and in private. General DataComm, Middlebury, CT 06782-1299, Tel. (203) 574-1118, Telex: 643357, Fax: (203) 758-4507.

In Network Strategies, There's Only One General.

Allied & AT&T  
Computers:  
A Moving Story.

Advanced Information Systems

Systems Division

Deserter

Chicago, Illinois  
February 23, 1989

Recently, Allied<sup>®</sup> Van Lines tied their corporate computer systems into one fast, efficient, distributed computer network. Allied's Chuck Wemer tells AT&T's Frank Mastro how AT&T's Distributed Network solution saved money for Allied and improved agent service.

**Frank:** You guys are pretty tough customers.

**Chuck:** (Laughs) You bet! There were a lot of frustrated folks here; some managers had to use six terminals to get complete answers about billing, tariffs, etc. We'd seen the power of distributed networking computing when you linked Purchasing's AT&T 3B2 computers to Accounting's IBM host. We wanted more, and we wanted it fast.

**Frank:** Many companies are trying to manage multi-vendor systems and applications, but yours were particularly complicated.

**Chuck:** Believe it or not, we were running accounting on the IBM 3090, claims insurance on the Qantel, tariffs on the DEC PDP, and claims checking on the Wang.

**Frank:** None of the computers could talk to each other. People really needed six terminals to answer some questions.

**Chuck:** We had to have true distributed processing, and AT&T was the proven choice. You have a technical edge with the Information Systems Network. Because ISN allows transparent access to *all* our different systems, we could replace six terminals with one AT&T 605.

**Frank:** Now a claim or bill is just a hot key away.

**Chuck:** Plus ISN saved us money when we moved to our new data center. We didn't have to rewrite applications; we just moved everything we already had, and plugged into the ISNs through voice wiring paths. No one believed it—true investment protection!

**Frank:** I'll never forget *that* weekend.

**Chuck:** We now respond to 95% of our agents' questions in three seconds. And we're seeing cost savings already.

AT&T 605 terminals each cost less than six months' rent on the old IBM terminals. We'll save a half-million dollars in expenses this year alone.

**Frank:** Plus everything runs over AT&T fiber-optic cable and twisted-pair wiring in your new building, instead of coax; you saved there, too.

**Chuck:** Right. We're delighted distributed networking customers of AT&T. We've had 3B2 computers in the field for years, handling shipment registration and accounting for agents. Your solutions are elegant: that's why your RFP won this time, over five other vendors. You know how to make our agents happy, and when they're happy, we're happy.

## Data sharing includes clients too

BY CARSON REED

More and more companies are extending the conception of information distribution to include customers. The question is, with the returns from this kind of effort sufficient to justify both the added investment and the possibility of reduced cost? Despite real problems, the answer is yes.

In cases such as home shopping and home banking, personal computer linkup programs have had a cool reception. These programs are being brought more in line with customer needs by eliminating on-site dedicated systems in favor of third-party service providers and shared industry systems. There are other issues to allowing customers direct connections into a corporate system, says Stuart Lipoff,

Arthur D. Little's Lipoff

director of advanced electronic development at Arthur D. Little, Inc., a Cambridge, Mass.-based management consulting firm.

"Everyone is concerned about security, control, propriety and even uptime, since if you offer a service to your customers, you can't just go down for service any time you feel like it," he says.

Still, dedicated or networked systems proliferate in a number of industries, and the markets continue to expand for electronic data interchange (EDI).

One reason that corporations are willing to invest is competition. Mark Levy, director of communications research at International Data Corp., a Framingham, Mass.-based research firm, says most decisions to share information with customers or clients are prompted by the need to keep pace with the service offerings of competitors.

"Regardless of the expense or the effort involved, it's viewed as mission-critical in some industries if you don't have or don't move toward this sort of ability," Levy says.

Executives at System One Corp., the MIS subsidiary of Texas Air, Continental and Eastern Airlines, examined the costs, benefits and disadvantages very carefully before setting up a

computer program that provides travel information directly to travel agents and corporate travel departments.

"We look at information sharing in two different ways: What sort of revenue are we getting back to offset the costs of the

services and what is the strategic value of having the sort of real-time information that's being added to our database by our own clients," says Doug Fogwell, senior director of marketing at System One's Chicago-based Airplan Services Group.

Airplan Services used to be known as Airplan Systems, Inc., which System One acquired in 1987 precisely because Airplan had already developed two systems that could provide direct travel information to agents. One program, Airpartner, helps travel agents schedule flights. A second program, Airassistant, is a software management program that examines what the travel

agent has done in terms of those flight arrangements and explains how those arrangements could have been improved. Both programs are available for a fee to travel agents or a large corporation's travel department, and those fees cover most of System One's costs, Fogwell says.

Mark Abitron, senior director of marketing at the Airplan division, says the strategic value

## Choose this,

Everyone's computing needs are unique. Which is why different people choose different solutions. And why so many diverse computing environments are being used today.

While this variety of solutions makes it easy for users to meet their needs, it presents some problems. Like sharing information between incompatible systems. The kinds of problems facing more and more companies as their information systems grow and diversify.

**Novell means freedom.** Fortunately,

you can solve those problems by making one simple choice: Novell. Novell's NetWare® operating system software supports a myriad of computing environments.

That means you have the freedom to network everything from PCs to Macintosh, VAX to PS/2, 386 to mainframe host systems. So everyone can use the workstations they choose, without changing the way they work.

The power to choose. With NetWare, Novell gives you the most powerful combination of network performance, security,

Based on a free-lance writer based in Denver.

of Airplaner — it helps travel agents provide the lowest airfare to their customers — is what prompted System One to offer information sharing.

At Great-West Life Assurance Co. in Englewood, Colo., the benefits of client connection are calculated in terms of shared responsibility for service quality. Great-West Life's Benlink system allows corporate policyholders

to update employee insurance using 64-K-byte random-access memory PCAs. This way, changes in status can be known directly, rather than via mail.

Karl Berry, assistant manager of Benlink systems support, says that the effort and expense of running an interactive system is negligible even after development costs are considered.

"Our MCI WATS lines are by far the single biggest cost component, but connect time is passed directly back to the users," Berry says. Likewise, computer time amounts to almost nothing for both the provider and customer; "Our CPU time is factored in at whatever the CICS prime rate is, with an hour of customer time amounting to maybe a minute of CPU time. In

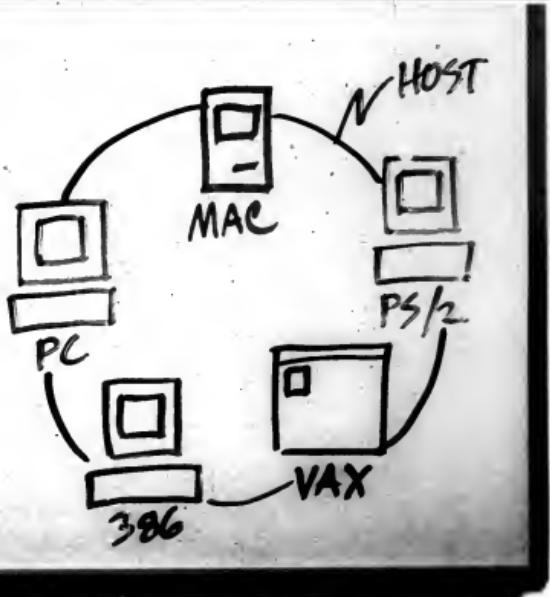

theory, we're recovering all of our costs from users, with the added advantage that companies are providing us with a more immediate update of employee information than we are keeping to themselves."

Great-West Life is now targeting its efforts more narrowly, attempting to back away from involvement in system leasing. Until now, the company has been

leasing PC hardware to client companies that were interested in direct access. Now, however, Great-West Life is attempting to limit access to clients who are already equipped.

Whatever form it takes, information sharing is here to stay, says Richard Morris, practice leader for logistics at Arthur D. Little. He says EDI is particularly attractive because the sender is the person who is in control, not the receiver, which restricts access to the computer.

"The first step is to eliminate key entry," Morris says. "The second step is to manage inventory through quick order to cut lead time. The third step is sharing the data, which offers unimaginable possibilities of win-win situations." ■

## and you can choose all of these.

functionality and system reliability available. Plus you get the power to transparently connect to any of the more than two million users worldwide who have already chosen NetWare.

And as your computing needs expand, the network will grow with you. Giving greater networking capability and allowing you to connect to new environments.

The freedom to choose. Exercise your freedom to choose the desktop environment that best meets your needs. Choose the networking power of NetWare. See your

**NOVELL**

For network solutions,  
you should be seeing red.

## Silent sharing

Most examples of distributed resources are visible to business users and in fact involve building a strong cooperative partnership with them. But there are environments in which the distribution is accomplished without the user knowing the difference.

That is the case with a project being conducted by Southwest Computer, the MIS subsidiary of Texas Air, Continental and Eastern Airlines. A group of specialists within the MIS organization have been assigned the challenge of designing distributed PC LAN applications to serve travel agents nationwide. The project's goal is to run a flexible set of applications at a lower cost than might be found with a mainframe solution. Neither the users nor the primary MIS staff that maintains the System One host network are expected to feel the impact of the distributed system directly.

"We're really isolating ourselves from the rest of the world," says Mark Altman, director of application development for the project.

"We don't want to force the field people or the general group to have to do anything special. The fact that this service is running on an OS/2 network is quite invisible to the users."

MICHAEL L. SULLIVAN-TRINITY

# Finally, A 4GL That Won't

When it's your job to develop broad applications for your company, the last thing you need from your software is limitations.

Yet instead of giving you wide-open choices, most 4GLs fence you in. They promise you flexibility, but what you

get feels more like a straitjacket.

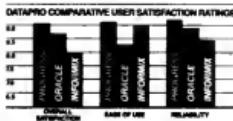

Enter PROGRESS. Truly flexible

4GL/RDBMS software that companies like Sherwin-Williams, Marriott Corporation, and Wendy's rely on to perform miracles every day.

Software that for the second year in a row earned the best overall user satisfaction rating among 4GLs (see Datapro Chart). That's used in 25 countries in fields as diverse as manufacturing, health care, and bond trading.

So what does PROGRESS have besides popular appeal?

For starters, automatic crash recov-

# Paint You Into A Corner.

erry and SQL. What's more, it lets you produce reports, perform queries, and paint screens with an ease no other 4GL can match. And because you write everything in our 4GL, you're guaranteed portability across UNIX, MS-DOS, VAX/VMS, CTOS/BTOS, and networks.

To test-drive a complete evaluation copy of PROGRESS, or to find out about our Demonstration Video, call today.

The only corner you'll ever paint yourself into is the corner office.

*That's*

## INTERVIEW

## When the walls come down

*Proximity does not always produce partnership. Kay Lewis Redditt says that the way to achieve peer-level exchange between IS and business is to remove all the usual layers of insulation.*

A couple of years ago, Kay Lewis Redditt and Thomas Lodahl began to pick up signals of a change in the structure of information systems organizations. Walls were coming down and information systems staff were beginning to move into business units. Redditt and Lodahl, partners in Capricorn, an Easton, Conn., information systems consulting firm, proposed a study of the phenomenon to the Society for Information Management (SIM). The resulting report, based on research into the experiences of 20 SIM member corporations, was released in March 1988.

In the course of that research, Redditt and Lodahl coined two phrases that they feel will help to further the discussion: "alignment," which refers to the relationship that corporations are trying to achieve between their IS organizations and their business units, and "dispersion," which describes the movement of IS staff and resources into front-line posts within business departments.

Next month, they are planning to move into a second phase of discovery, digging into methods of dispersing IS resources and measuring the effectiveness of such efforts. This new research will be done in collaboration with the Toronto consulting firm, DMR Group, Inc.

Redditt recently spoke with Computerworld Features Editor Joanne Kelchler about what the business alignment imperative means to the IS organization and how dispersion of information systems resources is likely to change the nature of IS management.

**You make a distinction between decentralization and dispersal of information resources. Will you define the difference?**

When you decentralize, you move IS personnel, but they basically still remain a group and they still serve a diverse user community. If you move a corporate IS group out into a regional location to serve all the business

units in that area, for example, that is decentralization. Geographically they are decentralized, but organizationally it is still a centralized group.

Dispersion means moving one or more IS professionals out into a business unit to serve one type of user. It also means moving them from the two kinds of isolation that IS has exhibited in the past. Before, IS either owned everything and dictated what was going to be done and when or acted like a service bureau. Neither of those approaches work. There has to be a true partnership between IS and the business.

Isn't that rather a tough assignment for IS executives who have been operating on the basis of different assumptions for many years?

It is difficult. That's why a lot of companies have opted for this dispersion kind of alternative, where you literally transfer the IS function to a business unit, have separate sections and have them report to their business clients. That way, they have to merge their goals with the goals of the business, because if they don't, they aren't going to be successful as individuals.

Is it feasible to try for a middle ground? Could you, for example, retain direct reporting within information systems and keep the group intact but have them serve just one business unit?

Absolutely. This is a long continuum, and companies usually move down it slowly. Often they'll start by decentralizing a group of IS people and then putting them in a regional office. Then they'll begin to migrate out more deeply and spin off first one and then more subgroups to work with specific areas such as marketing or finance. Gradually, it gets deeper and deeper into the organization.

And what about the reporting structures? Essentially what happens is that,

at first, the groups that get deployed to business units report on a direct line back to IS. But gradually, the dotted and straight lines shift. From direct line to IS and dotted line to business manager, the setup changes to direct line to business manager and dotted line to IS.

**Are business unit managers really off their oxen?**

**To have responsibility for information systems and IS personnel?**

By and large, we've found that most business managers think they want it. They feel that this kind of control over their own destiny is becoming absolutely essential to success. The development cycles and everything else have sped up so radically that they feel that they just can't wait for the traditional IS development cycles.

**You said they think they want it. Do they often find that they really don't?**

We have found that this is often a bigger bite than they thought it would be. Once they have IS people reporting to them, they find that they don't have the kind of management knowledge that it takes to manage these people and get the systems developed the way that they want. We had examples of business managers

who, once they had IS people reporting to them, said "Here, take them back. I just can't deal with this."

**What kind of problems could cause that sort of reaction?**

In the new environment, the IS people often feel isolated from the kind of support system that they had in a centralized organization. They also feel that their professional development paths are cut off. Then, too, business managers expect they'll get better systems out of this kind of organization, but the jury is still out as to whether or not that is true.

**Is there a danger of taking dispersion of IS too far?**

There can be successes all along the continuum — whatever works best for the particular situation. We did find from our research that total dispersion is very seldom the right solution because there are functions that need to be centralized.

**Such as?**

Standards, certainly. Also networking. In fact, say of the functions that have cross-business-unit applicability really need to be centralized. If they aren't, you end up with chaos. We saw several companies that dispersed too much and then had to retrace and identify and bring back those functions that they wanted to decentralize.

**Is it likely, then, that we will see the same sort of pendulum effect, in terms of dispersion, as with decentralization?**

It is certainly possible, but it is also totally avoidable. The pendulum swings back when you try to disperse too much, too fast. But dispersing is really a little like letting a genie out of a bottle. Once you move IS functionality into a local unit, you aren't ever

going to get it back completely.

#### Why is that?

What happens here, which doesn't happen in decentralization, is that the IS staffs become more diverse. They get molded into the organization and cross-pollinated, and job descriptions get fluid.

#### Are some firms more naturally suited to this kind of structure than others?

The overall culture of the organization makes a difference. The culture in which dispersion is easiest is one in which firms home-grow their own people. They hire generalists, usually directly from college, and grow their own people. It's part of their culture to move people around, so there is nothing unusual about individuals moving from one job to another.

#### You've talked about the kinds of firms for which dispersion is natural. How about the types that typically have trouble?

Companies that we found had problems in dispersing are those that were highly centralized and were reacting to the pressures for competitive advantage systems. Reorganizing in response to that kind of pressure can be very difficult for an organization that has been highly centralized.

Usually all of the career paths in such companies have been concentrated within very well-defined channels. Because professional development has always happened within specialized tracks and there has been little cross-pollination, IS people feel isolated and reign. Turnover among dispersed IS personnel in those kinds of organizations has been very high.

#### What is the role of the top IS executive in a dispersed situation, where most of his former staff now reports elsewhere?

I see it as critical. An analogy I like to draw is with the chief financial officer. Every enterprise has to have someone who worries, from the enterprise or company level, about the financial health of the organization. I believe that every enterprise organization must also have someone who worries about the information health of the organization.

#### Is that person likely to be the same one who is now managing the IS function?

We found that in these companies that were moving toward dispersing, the trend was to bring a business unit into the top 10 percent to effect this kind of change. There feel that IS needs that kind of influence to get it focused on the business issues that the company is facing.

#### Does that mean top IS managers should be concerned that they are going to be moved out by business types?

It is clear that companies feel a business perspective is important. I think that the people filling that role now are kind of 50-50, coming from the business side and the IS side. What IS managers should read into this, I think, is that they have to develop the kind of business skills and business focus that is required.

#### And how should they go about acquiring that focus? Should they disperse themselves for a while?

Actually, a lot of companies are doing that. In fact, two of the top IS people that I

interviewed in our study have already been moved out into a business job and are garnering experience out in the business.

#### They didn't see this as a demotion, did they?

Absolutely not. It was a promotion in both cases.

#### How many companies are really interested in pursuing some kind of strategy for distribution of information resources?

We found about one-third of the 20 companies we looked at were really doing something about this. And my assessment is that since then, the issue has become even more important. I don't know how many more are actually moving in this di-

rection, but a lot more recognize that they have to rethink their IS organization in order to position themselves for the 1990s.

#### Dispersion and decentralization weren't the only kinds of restructuring efforts that you found in your study group.

Some companies are trying to reorganize by setting IS up as an internal profit center. Others are trying to do a spin-off, where IS is not only an internal business but also contracts externally.

#### You've indicated that the results for that kind of an approach seem to have been mixed.

It does have some positive aspects in that, by running a business of their own, IS

managers then begin to have a deeper understanding of their clientele. They begin to understand what marketing is, what product marketing is. But the downside is that because the IS organization has to run its own business, it can't give full attention to the IS function.

#### It would also seem that, by operating IS as a separate entity, you are moving in almost the exact reverse of the goal of tying IS more closely with the business.

Exactly. The major thing that most companies are trying to achieve with their alignment strategies is to break down all of the walls between IS and the business. And making IS a separate business doesn't really achieve that. \*

## Unleash the power of SQL/DS in your VSE environment.

Attend a free seminar presented by Integral Systems and IBM to find out how

#### #1 Human Resource System

##### Available in SQL/DS

Integral Systems, the leading IBM mainframe human resource application supplier, introduces a system designed specifically for the VSE user that leverages the power of IBM SQL/DS. This database management system technology, our SQL/DS DB2 product, is a ideal vehicles for managing your enterprise-wide human resource functions: Personnel, Payroll, Benefits and a family of workstation products for the human resource professional.

#### Proven Track Record

As an IBM Application Specialist Business Partner, we received an Outstanding Achievement Award from IBM for our top selling, DB2 HR system. We've put the same care and

# Why you should buy computers from a company called Fujitsu.

Because their quality is uncompromising. And it shows in all the ways that make a difference to your business: Performance. Reliability. Service. Value.

That's not just our opinion. It's the opinion of companies and individuals who have placed us among the four leading computer makers in the world, with annual computer sales of over \$10 billion.

They know we make some of the fastest and most powerful scientific and business computers on earth. And that all Fujitsu computers have a reputation for quality and high reliability.

In America, Fujitsu's Series 2000™ PICK®-based family of products offers business professionals cost-effective solutions to their business needs. Ranging in capacity from the 18-user System 2100™ to the 160-user System 2600™, the Series 2000 family of business computers lets you choose the proper system for your current needs, with a clear growth path for future expansion.

Computers are our No. 1 business. But they're not our only business. You may already know us for our fiber optic communication systems. Or PBX systems. Or facsimiles. Or cellular telephones. Or even for advanced semiconductors and electronic devices.

They're among the thousands of Fujitsu products that make us a \$16 billion high technology leader, with almost 100,000 employees and projects in over 100 countries worldwide.

So if you're considering a computer system, we'll show you some very good reasons to consider Fujitsu. Write Fujitsu Microsystems of America, Inc., 3025 Orchard Parkway, San Jose, CA 95134. Or call 1-800-874-9927.

Series 2000, System 2000 and System 2600 are trademarks of Fujitsu Microsystems of America, Inc. PICK is a registered trademark of PICK Systems, Inc.

# IN DEPTH

## The best of both worlds

*Building today's hybrid systems development organizations*

BY ROBERT O. PETERSON

**T**hrough the inherent instability of advancing technology and the dramatic changes in computing philosophy, the organization of the software systems development department has taken many and varied forms. Indeed, the life cycle of the typical systems development organizational chart is significantly shorter than that of the systems those organizations produce.

Technology continues to advance, shifting development emphasis back and forth between the end user and the professional developer. Because the boundaries of those two philosophies remain in debate, it is difficult to predict, and therefore organize for, the final picture. There are, however, a number of critical factors that should be considered whenever any organization is either formed or changed.

Before considering these factors, note that the manner in which they are impressed upon the organization varies primarily with the organization's structure. Any structure inherited by the systems development manager should not be cavalierly changed without being understood — look carefully, at the factors that drove its formation. While descriptions abound, most organization structures represent hybrids between two ends of the spectrum: business alignment and functional alignment.

Peterson is an IS consultant based in Cary, N.C. His book, *Managing the Systems Development Function*, was published in 1987 by Van Nostrand Reinhold. He is currently working on an information systems planning book for McGraw-Hill.

When a development organization is aligned to the business side, it is generally reflected by broad application sets, which typically serve those departments that are functional to the business: finance, manufacturing, marketing and so forth. The subsettected areas tend to be, within limits, self-sufficient with analytical, programming and whatever other resources are necessary to service their application sets.

Business alignment is the more common organizational structure for several reasons. First, its rationale is obvious to all members of the company, especially to user management. This creates a simple working relationship with the user community in which task approval is essential to the organization's continued survival.

Second, it is very easy to manage. Resource levels are directly aligned and defined so project leading becomes a simple matter of matching people to a priority list until the man-hours are exhausted. Testing one function's justification and importance against another's is not an issue.

Third, it allows protective expertise to develop. People within systems development are able to attune themselves so intimately to the business area that it becomes difficult to feel them. This may seem counterproductive, even confrontational, but today, with users becoming increasingly literate, it is pragmatically essential. The systems development department's principal measure, in this alignment, will be a business-line manager's evaluation of the developer's knowledge of that function, not necessarily the technical knowledge of developing systems. For development to remain viable, that evaluation criteria must be

ROB MACDONALD

fully satisfied.

One of the largest high-tech companies in the East runs with this class of organization. An additional benefit for that firm is the fact that its IS group is funded directly by the divisions, and direct reporting lines simplify priority setting.

### Functional alignment

Functional alignment implies an inward, technocratic approach to development. The elements of a department with this type of orientation include a programming group, an analysis group and any number of ancillary support structures. When analyzing this structure, the reader may be surprised to learn that what is being sought — an organization that supports the function of developing systems.

In recent years, this class of organizational structure has fallen somewhat out of vogue. There are a number of reasons for this decline, but the predominant one is the desire to align the development activity with the business. Because the most obvi-

ous way to accomplish this task is to match organizational units of the company, upper executives have a swing more to the business alignment end of the spectrum.

However, there are two extremely strong factors favoring functional alignment. First, systems development is a very specialized discipline. For its activities to achieve a decent level of efficiency, the benefits to its internal operation must be maximized. This means that technocracy must have a major bearing on organizational priorities.

Second, despite the emphasis

given to the concept of the business analyst, the career transition from programmer to analyst is, in most cases, a fairly effective path. Programmer skills include a stringent focus, mental discipline and a breadth of technical expertise. These particular skills are invaluable to a systems analyst. Other career paths may be acceptable, but there is nothing inherently negative about starting as a programmer and moving to analysis. A functional orientation supports this very effectively.

A major manufacturer in the Southeast operates within a functional alignment and has found that concentrating on the technical issues has increased productivity substantially over its previous business alignment. Analysts work in user areas and generate either specifications or prototype models for the design/programming staff. The analysts and designers then deliver the product in concert.

#### Hybrid structure

Most organizational structures fall between a purely business and a purely functional alignment. Because every enterprise is different, there should always be some level of variation endemic to the enterprise. Some of the variations may be small, some dramatic, but there should always be something that uniquely defines the organization.

Yet some managers take individuality too far and concentrate exclusively on the characteristics they feel are unique to their situation. That orientation tends to automatically eliminate a number of relatively classical solutions. The desire to establish something new and revolutionary overcomes the more rational approach of examining what is common and adapting it to each situation.

Determining the priorities of the business generally points to the proper end of the spectrum of organizational structure. A company that sees its business functions as operating in near isolation will need a development group oriented toward application and business functions. Conversely, a company that sees these boundaries blurred and integrated will lean toward the functional alignment.

Other factors will enter into the equation, but they will generally tend to adjust the structure according to the position established by the business characteristics. Analyzing the business will be far the single most important factor.

One successful example of a hybrid structure occurs at a national manufacturing firm. All internal activities, including programming and systems development, are organized for purely functional advantage. There are, however, several analysis groups aligned and funded along business lines. While some prioritizing problems continue to come up, the structure has been intact for nearly seven years.

Whatever the systems development department's structure, it is crucial to know what you do as an organization and as a company when establishing an organizational plan. While this seems self-explanatory — systems development develops systems and ABC Co. sells widgets — it isn't always that simple.

First, the orientation of the firm is extremely important. A company that deals with government contracts must concern itself with written, approved procedures and stringent quality control. The systems development department must be sensitive to this characteristic, regardless of how removed it may be from the product or service being contracted.

**T**HESE PARTICULAR SKILLS are invaluable to a systems analyst. Other career paths may be acceptable, but there is nothing inherently negative about starting as a programmer and moving to analysis.

Similarly, a firm that deals with a highly competitive product must concern itself with customer service. Any contribution systems development makes to formulating customer order tapes to providing customer access information systems, may make the difference in landing a customer or not. In any case, IS divisions and their development groups must absolutely understand the thrust of the

business as well as their opportunities to contribute to it.

As important as systems development's place in the business role is its thorough understanding of precisely what it does. If the primary thrust is supporting end-user development via fourth-generation tools, isolating the organization from the user community would be a mistake.

When dealing with a predominantly

packaged software environment, application analysis skills are needed more than conventional programming expertise. For firms that develop their own software using conventional languages and requiring stringent quality control, an organization that emphasizes a more functional alignment is more appropriate.

Organizational upheaval is always difficult, even when the changes cure a number of ills — indeed, in most cases, that is the motivating factor. Unfortunately, change can negatively affect a number of positive facets of an organization as well.

When establishing a systems development organization, keep an eye on its stability. Many factors may cause additional change and confusion, but it should not be caused explicitly by the organizational

*"Obviously these people never considered the advantages of incorporating planned rentals into their capital equipment acquisition strategy."*

© Leasametric, Inc. 1989

structure itself. When base-line stability does not exist, it is typically because the structure was established in response to situational pressures.

The most obvious example of this scenario is the establishment of a department that is really a project. The new department will invariably possess all the components that exist within the systems development department itself. The project is stand-alone. Because most projects eventually end, mass disarray is the final result, as the project/department is melted back into the real world.

Avoid this level of instability at all costs, because projects of intense importance and visibility will periodically take place. The frequency and length of those events is one factor involved in knowing

what it is you do. Project orientation can be dealt with by organizational structure, but only if it is considered in the first place and only when inherent stability is a high criteria in establishing that structure. If the organization's structure — not necessarily its population — cannot be projected consistently through several years, it is probably not a good one.

#### Time while It Lasted

One company experienced this problem during a computer effort that spanned a two-year period. The functionally self-sufficient project/department operated quite effectively until the project ended. IS management then found that seniority levels, management layers and procedures were replicated. It took a slowed

economy and resignations to resolve the issues.

Common sense is often ignored when establishing a systems development department. A well-intentioned effort toward a classic structure or stressing the opportunity to use new and sophisticated tools has led many IS managers to severely cripple a systems development project. Things that look very good on paper can be very bad in execution.

The most common mistake is to totally ignore the situation when a department is established. Structured disciplines, for example, when implemented formally, require a substantial number of people assigned to make them work. It does little good to have the same five people reviewing each program that has been developed. How-

ever, formal structured disciplines have been the driving force in many reorganizations of departments with fewer than five programmers. Common sense says it just won't work.

Equally dangerous is establishing an organizational structure without adequate skills to populate it. Obviously, a five-person database administration group will accomplish very little if it has virtually no experience, but sending all five off to a set of classes does little good either. All too often the desire or need to move forward with an organization results in a glibly irrecoverable step back. The situation occurred with an East Coast firm. It sent their three database management systems before its staff caught up with the technology.

Without a doubt, the quality and dedication of the people within any organization will determine its strength. To some extent, an organizational structure can simply be considered a way to provide the

PEOPLE DO move, and departments without the strength to withstand this cannot hope to function effectively. Each change completely reshuffles the structure, increasing discomfort among the people in the department.

best people with the opportunity to do their best work. Notwithstanding these principles, the structuring of a systems development organization must go beyond people.

There must be real stand-alone strength in how the manager sets up the department. The acid test for this factor is whether the department could function if the names were taken out of the organization chart or if they were swapped around. It does not need to function as well, but it should be able to function.

Organizations that do not have stand-alone strength cannot stand much flux. People do move, and departments without the strength to withstand this movement cannot hope to function effectively over time. Each move in any individual will completely reshuffle the structure, possibly increasing discomfort among the people in the department.

#### Evaluation

An effective organizational structure takes into account the need for the systems development group to evolve in sync with company needs. This, of course, presumes some knowledge of where the company is moving, but that is not a luxury every systems development manager has. Additionally, the future can only be a vague picture of direction. Given the dramatic upheavals and direction changes common in business today, concrete movements are really only valid in the short term. But this mobility does not imply that the manager is helpless.

The IS manager must constantly be assessing the directions of economy policy to determine the potential impact on the development area. A movement of support and administrative functions from the central to remote locations implies an eventual need to structure aspects of systems development around those remote

At this point, it's hard to tell which end of the system is in charge.

Systems managers once held complete control over all computers. Now, PCs and workstations are everywhere, with their users howling for mainframe access.

Since MIS/DP won't play dead, and users hate to beg, Network Systems introduces a solution: LAN II™.

LAN II disciplines the chaos of PCs, PS/2s, Macs, workstations, and local area networks. It works with familiar protocols and media, like Ethernet. And LAN II connects micros to other systems through our high performance HYPERchannel®-DX network.

In short, LAN II helps MIS/DP put desktops on a leash, while users get mainframe access.

For more on LAN II products, consulting, and worldwide support, call 1-800-338-0122. We'll help keep the tail from wagging the rest of your system.

 **Network Systems**.

# Why is Computerworld the best read publication\* among MIS executives in America?

Because it's the only weekly computer newspaper to offer complete coverage of every aspect of the information system. Can you afford to be last on the routing list for the news you need? Well now's the time to order your own subscription to *Computerworld*. That way you'll stay abreast of all the latest news, products, people, developments, trends and issues — things professionals like you need to know to get ahead. And stay there.

Don't delay, order now. You'll get 51 information packed issues. Plus special bonus sections of *Computerworld Focus on Integration*. You'll also get our special Spotlight section . . . featuring detailed head-to-head comparisons of the industry's latest products.

Use the postage paid subscription card bound into this issue and get your own subscription to *Computerworld*.

# COMPUTERWORLD

facilities. It may not mean relocation, but, at the least, it will require enhancing the techniques for distributed development.

The development manager can reasonably be expected to create a model of the department and the company and to evaluate changes to them now. The only problem with that approach is in the enhancement of market share levels that may turn out to be unnecessary. However, being caught with a need to change in a compressed time frame is far more severe than excess knowledge.

#### Flexibility

Computer system dependency has become so prevalent in today's business environment that any substantial change in the business places a heavy demand on

systems production. Either entirely new systems or such tremendous levels of enhancements are required that projects tend to spring up overnight with corresponding demands for human resources. When flexibility is not considered in the organization, this ebb and flow of demand can be devastating.

A Texas-based company that expends by acquisition has solved this problem by having product-line specialists as an integral part of the systems development group. As the new firm is absorbed into the parent company, the developers are likewise assimilated until only a few remain tied to the product line.

Building flexibility into the organization is largely dependent on where in the structure spectrum it lies. Functional or-

ganizations tend to find their flexibility more obvious because the grouping of skills is consolidated around internal issues. Programming talent can be shifted from project to project or application to application with relative ease.

In a business alignment, the absolute numbers of programmers or analysts tends to be thinner, and moving from one area to another can affect any number of sides, not the least of which is different managers and philosophies.

The problems with this type of resource shuffling can be solved by using contract personnel, co-op students or a pool of nonaligned employees — that is, staff yet to be assigned to a specific area within IS.

A communications company in the Southeast added flexibility with a combination of organization, creative personnel usage and computer-aided software engineering tool implementation. Its systems development group has nearly reached the point at which it creates and supports systems in total response to business prioritization.

#### Technology sensitivity

Systems development organizations, for years, have been accused of being too technical. The response, since many development managers enjoy being paid, has been to project a more non-technical orientation. However, the bottom line is that the development of computer systems is predominantly a technical exercise carried out by technicians.

Organizationally, the IS manager must ensure that the department remains sensitive to the impacts of technology. There should be an individual or group evaluating technology changes to see what potential benefit exists for the company and how effectively it may be implemented. Often, this responsibility is found in an independent planning group, but development managers must also retain control of those prospects are being addressed.

Beyond evaluation and study, the principal vehicle the manager possesses to remain sensitive to technology issues is in project loading: for each project, devote only the personnel needed by determining early on the man-hours that will be required. Then you can free up some staff for research. Holding a reserve for internal new product study and assigning analysts to this task between projects works very well to keep the department abreast of new and emerging technologies.

#### Political pragmatism

The realities of corporate life insinuate themselves into organizational issues such that political pragmatism is often far more critical than any other factor in building a systems development organization. The manager's job is to make sure that politics, whether positive or negative, do little to benefit the organization or the people within it. The politics of the company and the people who drive it must be taken into account or else failure is inevitable.

Sensitivity to political issues can result in establishing a relatively independent group to service a strong, influential user community or absolutely avoiding a structure that has a negative connotation. In any case, try maintaining a constant flux of slow change instead of allowing it to occur abruptly or quickly. Moving in this fashion installs a sense of confidence in the department and allows the manager to accomplish the goals over time.

Organizations can be viewed simply as a stratification of people by optimization of their job performance. However, most people view their existence as an obligation to an inspiring direction to their working lives and the career ladder they must climb. Its proper structuring can make the difference between the success and failure of a department, regardless of how good the people are.

Constant change or absolute stagnation of that structure will inevitably drive people away and retard the ability of the company to grow through effective information usage. The successful manager is sensitive to the organic nature of the systems development department's structure and uses it as a means to accomplish the goals of the corporation. \*

## UNIX® System Videotape Training. We developed the System. We set the training standards. You set the pace.

AT&T. We created the UNIX System. We set the standards for training. And we developed the AT&T Videotape Library—a comprehensive series of tapes that lets you learn *at your own pace*. In your own office. And is an invaluable reference tool for the entire staff.

At a price much lower than you'd expect to pay.

Choose from UNIX System fundamental training in Basic, Intermediate, and Advanced. Courses on Shell Programming and C Language. And UNIX System Security and Administration. Plus Database Management Using INFORMIX-SQL®.

All with full color high-resolution graphics and video blackboards. And backed by our exclusive telephone support line. Giving you direct access to expert AT&T instructors.

# BUNDL® DELIVERS!

## Automated report distribution the way you want it.

Department A gets the whole report. Location B receives only its pages. Supervisor C needs the location summaries from all applications combined—online. BUNDL delivers exactly that. On time. Every time.

### System Managed Output

Just automating MVS report distribution is not enough. BUNDL is an all-in-one product that brings automation to the production, archiving and online viewing of reports.

BUNDL puts MVS to work and puts you in control. It eliminates manual tasks and unneeded reports. It eliminates reruns. It bundles reports from multiple applications.

### WYNIWYG

What You Need Is What You Get. BUNDL is effective because it gets users involved. BUNDL's online View facility lets them look at reports. Re-arrange information. Produce reports on paper or file. Or archive reports for printing or reprinting later.

### Leading in Automation Technology

Multi-image Manager in 1981. AutoMate in 1987. CheckOut/VM in 1988. Now BUNDL in 1989. We've become the recognized leader in the technology and support of Automated Operations.

Don't wait for automated report distribution. For delivery, call 412-323-2600 and ask for your LEGENT account representative.

**LEGENT**

## INDUSTRY INSIGHT

Charles Varga

### Productivity: Take your best guess

To all of us who read the daily financial press or run the companies which it reports, May delivers not only the rites of spring but also the rites of new statistics.

This month's harvest tells us that although productivity and productivity growth have increased slightly in the manufacturing sector, productivity growth has remained stagnant in the business services sector, in which 70% to 80% of all Americans are employed.

Oh, really? How can anyone tell?

Bruce McAdam, from the U.S. Department of Commerce International Trade Administration, pointed to growth across the board in the computer services sector, particularly in several areas touched by the computing and information processing fields. However, McAdam also noted that the lack of adequate data on sources and growth precluded a discussion of productivity in these self-same growth areas.

Not everyone is so deterred.

Many experts have said that we are living in a world of paradox characterized by advancing technological changes. Some experts have said that the process by which new technology is assimilated, increased and updated industry is continuing out in the U.S. They also see a sharp decline in the growth of productivity, especially in the services sector.

Within the data and information processing area, Nobel laureate economist Robert Solow recently commented that computer capacity, including

## Video power boost

*Game pioneer targets corporate programming*

BY J. A. SAVAGE  
CW STAFF

MOUNTAIN VIEW, Calif. — Playing video games started Steve Mayer thinking that with high-quality video graphics, computers could deliver better entertainment than television.

Back in 1976, Mayer, one of the founders of Corp., saw that technology did not allow high-quality video and interactive video.

When Mayer has founded his latest start-up, Digital F/X, Inc., he is finding the way to integrate the two, posing the company at the starting gate for high-definition television (HDTV) and on top of the digitized video post-production market.

"The company is at the intersection of computers, video game and electronic typography," said Mayer, who is Digital F/X's chairman.

With one setup — monitor, two keyboards, sketch pad and minicomputer — the DF/X 200 replaces a production room littered with specialized machines for animation, editing and special effects.

#### Puttin' on the glitz

While an extremely specialized and expensive product — the typical price is about \$140,000 — the DF/X 200 fits neatly into the burgeoning corporate video market and in television for generic animation and special effects to glitz up standard programs.

It can replace diverse systems in a post-production environment costing five times that much, according to Richard Shaffer, president of New York-based market research firm Technological Partners.

"More money is being spent on corporate programming than

TV. Corporations want a good signal; otherwise, employees will turn off," said Daniel Roberts, Digital F/X's vice-president of sales. "Corporate programming is more challenging than entertainment."

According to Roberts.

Mayer is quick to point out that his product is not HDTV — at least not yet.

"It's beyond current broadcast quality, but there are no standards for what HDTV is," Mayer said.

#### Ready to adopt?

In other words, if there were broadcast standards and televisions available to receive higher quality transmissions, Digital F/X's technology would be ready to adapt to that. If something other than HDTV develops for the U.S. market, Digital F/X has a likely technology for exploitation.

Shaffer thinks that U.S. companies will use digitized video, like that of Digital F/X, to produce HDTV versions of their Japanese technology of speeded-up and compressed-sound transmission. This could be accomplished by direct transmission through fiber-optic cables to each home.

Digitized video, which relies more on software expertise than

*Continued on page 36*

Digital F/X's Mayer doesn't stop at video graphics

For corporate video, Digital F/X claims its product can bring down costs while preserving quality. "Corporations don't have the budgets that are used for a national beer commercial," Mayer said.

However, the largest potential market is in television, ac-

## Adapsos addresses identity crisis

BY NELL MARGOLIS  
CW STAFF

SAN DIEGO — The 800-plus conference came for seminars, speeches and networking. But for Adapsos board members, the software and services industry association's 70th management conference, held here last week, had a hidden agenda: to make headway toward resolving an

identity crisis that has resulted in dissatisfaction, defections and donor drain.

The conference, by most accounts, got what they came for. So, according to Adapsos Chairman Lawrence Welke, did the board.

So far this year, Adapsos has lost \$215,000 because of resignations, prominently including those of Lotus Development

Corp. and Control Data Corp.; last year at this time, the corresponding figure was \$6,000.

Rather than leave and members attrited, Adapsos is bleeding roster to its failure to keep pace with its constituents' changing needs. In particular, according to numerous conference attendees, Adapsos has been slow in recognizing — and a no-show in addressing — the requirements of the burgeoning desktop software community.

• An already aggressive program led by a young entrepreneurial committee will be strengthened even further.

• Adapsos will be going local. Exactly what form the grass-roots efforts will take has yet to be decided.

What is definite, Welke said, is that it will happen, and soon.

"If we want to represent smaller and newer companies," he said, "we can't expect their heads to be able to take off three days from work and travel across the country to come to us. We have to take Adapsos to them."

• In a move very welcome among members, continuing a staff Adapsos membership fee scale — currently set at \$500 to \$70,000 per year and based on a company's software sales in the preceding year — is under review.

Also under consideration is a merger with the Information Industry Association, with whom last week's conference was co-hosted. However, the board agreed to further consider a draft merger prospectus. Welke's vocal enthusiasm notwithstanding, a majority of Adapsos members and observers interviewed last week believed that corporate cultural differences and love of turf will restrict the relationship to joint activities short of marriage.

## MIT flunks U.S. firms

A two-year study conducted by 16 top-ranked MIT faculty scientists, engineers and economists assessed corporate America's position of profitability and competitiveness and gave the country a failing grade in each.

The 344-page MIT report, released this month, is titled "Made in America." The report cites massive deficits in basic education, entrenched lack of vision in the corporate front office and misplaced priorities across the industrial board as breeding a business culture that has grown outmoded and ineffective. The cross-disciplinary MIT commission targeted eight U.S. industries, including semiconductors and computers, and concluded that the hearts and minds of U.S. workers and managers are trapped back in an American industrial golden age, where the only new thought to get through has been the current — and disastrous — obsession with quarterly profits.

Michael L. Dertouzos, who heads MIT's computer science laboratory, pointed to Perkin-Elmer Corp. and Control Data Corp.'s ETA Systems division as operations that, in opting for short-term profits over long-term planning, were good for the computer industry but bad for the country in the long run.

A drastic retelling of how the U.S. thinks about business will be necessary if the country hopes to compete in the international economy, the report concluded.

# Graphics firm sprang from blackboard jungle

BY JULIE PITTA  
SPECIAL TO CW

**BERKELEY, Calif.** — As a professor of computer science and electrical engineering at the University of California at Berkeley during the 1970s, Herb Baskin's only prop during lectures was chalk and a blackboard.

It struck him that there had to be a better way. "Overhead projectors and transparencies were state-of-the-art technology," Baskin remembers. Typically, each department had a couple of overhead projectors that were shared by faculty. If they were in use, it was back to the chalkboard.

Baskin was not a typical academic. Before embarking on a teaching career, he had spent 13 years at IBM, where he was director of systems research, and another few years at Datapoint Corp. At the latter, he led a team that developed a color graphics system designed for business presentations.

After 11 years of university life, Baskin was ready to return

to industry. In 1981, he started General Parametrics Corp., bringing along a UC graduate student who had specialized in computer graphics. He funded the company with \$150,000 of his own money.

**Apple blossoms here**

It was the beginning of a technological boom. IBM had just introduced its first personal computer. An upstart, Apple Computer, Inc., had launched its Apple II. "I could see that there would be incredible use of PCs in the corporate world," Baskin says. "They would be used for everything. I could see people using PCs to prepare presentations that you could have done using larger machines."

In 1984, General Parametrics introduced what are today its flagship products: PictureIt, a graphical software package for the IBM Personal Computer, and Videoshow, a hardware device that connects a PC monitor or a projector.

With PictureIt, users could create presentations using charts, graphics and text. Using

Videoshow, they could display the graphics with the aid of a remote control. The products were not to be sold through a network of retail outlets.

Baskin targeted corporations and the federal government. Unfortunately, his university col-

Baskin founded General Parametrics in 1981

leagues were left out of his strategy. "Teachers don't have the funds," he notes. By that time, General Parametrics had attracted the attention of a couple of high-profile venture capital companies — Sevin-Rosen Ventures and Kleiner, Perkins, Caufield & Byers. Each firm invested \$3 million.

Propelled by sales of PictureIt and Videoshow, General Parametrics grew to about \$23 mil-

lion in revenue for 1987, earning No. 15 spot in *CW*'s magazine's list of fastest growing public companies for that year. *Inc.* estimated its annual growth rate at 191%. Fast-growing Sun Microsystems, Inc. earned the No. 17 slot in the *Inc.* list.

General Parametrics expanded its line to add more desktop presentations-oriented software packages and more sophisticated versions of Videoshow.

Today, General Parametrics boasts sales to some of the largest corporations in the U.S. Videoshow is used in the board rooms of Coca-Cola Co., American Express Co. and General Motors Corp.

Della Steen, a systems analyst at Chevron Chemical Co.'s IS group, said her firm uses Videoshow and other General Parametrics software packages.

"Creating slides was costing us between \$8 and \$15 each," Steen says. "This way we can use a \$5 diskette over and over again."

Today, General Parametrics has embraced Apple's Macintosh, a logical expansion for a company that has focused its business on graphical presentations. Also, it will support IBM's Personal System/2.

Steen is a former Computerworld West Coast senior correspondent.

## IN BRIEF

### Taken for granted

The National Science Foundation last week renewed five-year grants funding four supercomputing centers. Offering high-power research opportunities now through 1995 are centers at Cornell University, the University of Illinois at Urbana, Carnegie-Mellon University and the University of California at San Diego.

.....

### Popping the poison pill

Compaq Computer Corp. last week added its name to the swelling ranks of computer companies that have adopted stockholder rights plans aimed at staving off unwanted acquisitions.

.....

### It's baaack

A 3-year-old tax controversy reared its head last week at Adaps' 70th management conference, when company leaders cited the Internal Revenue Service for "reckless vigilance." Several dozen corporate chief executive officers in attendance volunteered to show the IRS documentary proof that some firms are continuing to classify some tech workers as independent contractors, rather than employees, in violation of the 1986 tax law. What's in a name? In this case, exemption from withholding taxes and larger deduction for the scofflaws and exposure to billions of dollars in fines and back taxes for some of the country's leading corporations, according to the angered CEO.

.....

Mosbacher wears a modest federal HDTV supporter

"I think they're hoping Uncle Sugal will fund it, and I don't think they should depend on it," said U.S. Secretary of Commerce Robert A. Mosbacher.

Mosbacher indicated that federal support for an HDTV industry is likely to be more modest, such as the \$30 million in research grants now available from the Defense Advanced Research Projects Agency (DARPA).

The commerce secretary added that he leans toward relax-

**I** THINK they're hoping Uncle Sugal will fund it, and I don't think they should depend on it."

ROBERT A. MOSBACHER  
U.S. SECRETARY  
OF COMMERCE

ing antitrust constraints on joint manufacturing and improving tax incentives to boost the HDTV industry. The Bush administration plans to outline its official HDTV proposal in July.

The AEA plan, drafted by the Boston Consulting Group, calls for the following:

• The formation of the Advanced Television Corp. as a government-industry consortium that

would guide the development of the U.S. HDTV industry. It would own the HDTV technology and sell it at a discount to manufacturers that manufacture the equipment in the U.S.

• Allocation of \$50 million over three years for agencies to develop HDTV standards.

• Obtaining \$300 million over three years for DARPA's research grants, which would be a 10-fold increase in the current program.

• Securing \$500 million in low-interest loans and \$500 million in loan guarantees to help build HDTV factories.

• Legislation or regulatory moves to resolve antitrust problems and to ensure that HDTV standards are owned by the U.S. government or the consortium.

• Government efforts to speed up the installation of fiber-optic cables to U.S. residences.

.....

### It's coming

Compact Disc Interactive (CDI), a hybrid sound, text, image and motion video technology system, is a smart bet to make serious strides in the entertainment, education and information businesses, took a giant step closer to market last week. Japan's Matsushita Electric and Seiko Corp., joined forces with the Netherlands' Philips Consumer Electronics to promote and develop CDI.

## High-definition TV plan comes into focus

BY MITCH BETTS  
CW STAFF

**WASHINGTON, D.C.** — The U.S. electronics industry has unveiled a blueprint for building a U.S. high-definition television (HDTV) industry, including a request for \$1.35 billion in federal grants, loans and guarantees.

The American Electronic Association's (AEA) master plan, set forth at a congressional hearing May 9, envisions a government-industry consortium of major proponents that they believe will provide a host of beneficial "ripple effects" for the semiconductor, computer and communica-

tions industries.

For example, experts said an HDTV industry could develop compact, flat-panel displays and create a market for U.S. semi-conductors [CW, March 13].

Pat Hill Hubbard, an AEA vice-president, said that government help is needed since U.S. businesses view HDTV manufacturing as a risky venture with low profit margins and a long wait for a return on investment.

Although Congress and the Bush administration want to support the development of high-tech industries in the U.S., the high cost of the AEA proposal will be an obstacle.

According to Roberts, digitized video is a good deal easier to manipulate than analog. For instance, he said that it can handle color and brightness at the same time, unlike analog television.

Two major investors in the project are computer companies Apple Computer, Inc. and Intel Corp., according to Mayer. Other investors include Stanford University and Mitchell Kapor, founder of Lotus Development Corp.

In the initial year, Digital P/KX's product has been available. Roberts estimates the company has sold about 100 systems.

## Video

FROM PAGE 95

Japanese HDTV could be an indigenous answer to the technology, according to Shaffer. "Companies like Digital P/KX could be important," he said.

The technology for digitizing video is math-intensive. "It would take several Crays in parallel to do the same arithmetic," Matsuura said.

"We had to build a very powerful image processor — two billion arithmetic calculations per second," said Mayer, who also claims the product is "tooled for real time."

Object management opens the door to a whole new world of computing. It is the gateway through which the rest of the people who were afraid of, or scared off by, the complexity of computing will pass. It reverses the trend that users were positioned at the convenience of the computer — towards a model where computing becomes a convenience of the user.

## Rabbit pulls foxy moves to avoid briar patch

BY PATRICIA KEEFE  
CW STAFF

**MALVERN, Pa.** — A steady downward trend in revenue has forced Rabbit Software, Inc., to pull a turnaround specialist out of its ranks to rein in and refocus the underperforming company. But don't expect a magical recovery.

Alfred Berkeley, Rabbit's chief executive officer and board chairman since January, is a man who pulls no punches in assessing the company's problems. "Rabbit was racing to opportunities, trying to hit home runs with a small number of small contracts [when it should have been]

dictating its own course," he said.

"Marketing our source code product to OEMs was eating us alive with support and customization requirements," Berkeley explained. Two OEM contracts with Ungermann-Bass, Inc., and Motorola, Inc., were the culprits.

Berkeley is trying to get the supplier of Systems Network Architecture (SNA) software back on track by switching from its OEM focus into the end-user market. He is targeting the world's 1,000 largest communications equipment purchasers.

The carot on a stick offered to users will be Rabbit's traditional gateway and workstation SNA business. "We'll have a

standard set of code that will allow you to work on DOS, Unix, OS/2 and various user interfaces, bus structures and communications protocols such as X.25, DFT and SNA," Berkeley said.

Rabbit has gone through \$20 million in investment capital and another \$20 million in revenue over the seven years of existence, according to Berkeley, a 17-year veteran of Alex Brown & Sons, Inc. He is on leave from the Baltimore-based investment house to revamp Rabbit.

"Rabbit was trying to do too many things, dissipating its resources on [tool] broad a spectrum of products, channels and delivery modes," he said. However,

work on Rabbit's alternative to IBM's Communications Manager is still under way.

Besides the massive spending, Berkeley said, Rabbit was beset by chaotic shifts in strategy, target customer bases and marketing directions. The result was several miserable quarters. The latest of these, first-quarter 1985, saw a sharp decrease of 46% in revenue over the same period in 1984. Rabbit lost \$1.9 million for the quarter, ending with a loss of \$292.9 million for first-quarter 1988.

Berkeley candidly admitted that as many as four more loss quarters could follow before the company generates a positive cash flow. "Revenues will look terrible. I don't care about profits right now. This is not a sprint, it's a marathon."

# REALIA OFFERS A RADICAL APPROACH TO PC SOFTWARE SUPPORT:

## REAL ANSWERS.

When you call with questions on Realia COBOL, RealCICS, RealDL/I, or any other Realia PC programming product, you talk to an experienced programmer. Our technical support staff knows the mainframe, the PC, and the Realia products. If your question stumps them, they have direct access to the system designers. So you get the answers you need. Even more startling: If you leave a message, we call you back.

If you encounter a problem, we'll help you analyze and fix it, even if it requires an interim version of our product.

Even our upgrade policy is user-oriented. We send each upgrade automatically to all first-year users and all others who continue under maintenance for an annual fee. So you don't have to fill in forms and send money every time we announce a new release.

You don't have to send money to try a Realia product, either. Just call us for a 30-day free evaluation.

## Varga

CONTINUED FROM PAGE 95

word processing, is producing information that nobody wants, let alone needs. If this is indeed the cynical explanation, then maybe the problem is one of measurement. Our government has not yet developed a way to measure productivity in many service industry sectors, including information systems services, leasing, diversified financial services and banking.

John Young, chief executive officer of Hewlett-Packard, recently noted that productivity in the entire services area has been poor. A recent study by the Brookings Institute noted that measurement errors account for no more than a third of the slowdown in the services sector. Others have noted that productivity is down because of a scarcity of labor.

How do they know? "There is not enough illumination on the subject," said Zoltan Kenessey, senior economist at the Federal Reserve System's Division of Research and Statistics. "The fact is that no one really knows what's going on regarding productivity, let alone productivity growth, within the services sector. It's a very complex subject."

Between 1981 and 1988, the U.S. Department of Labor's Bureau of Labor Statistics noted that employment within the computer and information processing services industries increased from 312,000 to 729,000 employees. Productivity has risen from \$40,500 in initial revenue per employee to \$90,000 during that period. Yet productivity growth has decreased from 4.6% to 0.6% per year. By the simplest definition, productivity equals output per man-hour. Or, if you prefer, woman-hour. Output per person-hour? Maybe just plain output.

But, productivity growth? What does that really mean? Especially in the services sector. Generalizations about lifestyle and quality of life — whether you require two television sets in every room, three videocassette recorders, four microwaves and two telephones in every car — don't say anything. The fact of the matter is that no one knows what's really going on in the area of service sector productivity and productivity growth. Generalizations from Nobel laureates and CEOs who purport to give us answers just raise some interesting questions.

Varga, a 20-year computer industry veteran based in Freehold, N.J., is publisher of "The Gartner Report," a study of industry mergers and acquisitions.

# Faint praise for FSX deal

Pact seen as better but still lacking in source code safeguards

BY MITCH BETTS  
CN STAFF

**WASHINGTON, D.C.** — Despite general agreement that the latest pact with Japan for co-production of an FSX fighter plane is a better deal than the U.S. has usually received, critics still consider it a technology giveaway to a high-tech rival.

A key issue in the debate is the extent to which the U.S. partner, General Dynamics Corp., will provide aircraft software to the Japanese partner, Mitsubishi Heavy Industries, at a time when Japan is trying to build up its aerospace industry.

The original agreement negotiated last December "would have turned over all of the source code — the industry's crown jewel," according to Thomas T. Claffey, an Los Angeles attorney and trade consultant.

However, after protests from inside and outside the government, the Bush administration negotiated a "side letter" to place restrictions on technology transfer. "It seems like the U.S. is getting a little bit smarter now" in terms of protecting source code, Chan said.

Under the revised agreement, General Dynamics and Mitsubishi will modify the U.S.-F-16 fighter to produce about 130 FSX planes for Japan. General Dynamics is supposed to get 40% of the design and production work.

Critics, asserting the U.S. should have insisted that Japan buy F-16s, argued that the safeguards against technology transfer are weaker than they appear. In addition,

they said, Japanese industry will be learning valuable systems-integration techniques.

Rep. Richard A. Gephardt (D-Mo.) faulted the administration for putting the revisions in a side letter rather than in the actual defense agreement. "The Japanese are masters at interpreting such side letters to their own advantage, as in the semiconductor and supercomputer agreements," he said at one of the many hearings held in the last two weeks.

In congressional testimony, Defense Secretary Richard B. Cheney said the FSX deal is better than having the Japanese build the plane with European partners. He testified that technology-transfer concerns have been addressed in the following ways:

• The avionics hardware and software will be developed by Japan with no U.S. involvement or technology transfer.

• Source code for the flight-control system will be developed either solely by the U.S. manufacturers or solely by Japan. The only software transferred will be the source code for the fire-control computer — which controls weapons — but only to the extent necessary for integration with Japan's avionics systems.

• Such provisions will be strictly supervised by several U.S. agencies. "The software technology transferred will not assist Japan to become a competitor in the aerospace industry," Cheney testified.

Two critics, Sen. Alan J. Dixon (D-Ill.) and Jeanne Shaheen (R-N.H.), said that while the Bush administration is telling Congress that only the fire-control software will be released, the side letter to the

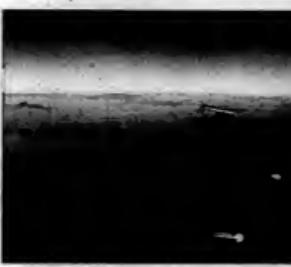

deal itself is only a little better than the original.

In a recent newspaper column, Prestowitz said the restrictions on software transfer "are meaningless as long as they are not enforced." That is the point.

Moderate senators such as William S. Cohen (R-Maine) observed that the FSX deal has reached a high profile at a time when Americans have a "deep-seated resentment" over the U.S.-Japan trade deficit, the semiconductor trade agreement and the Toshiba Machine Co. scandal.

The tensions were reflected when the Senate Committee on Foreign Relations supported the FSX by a close 9-8 vote that crossed party lines. The full Senate's vote on a resolution of disapproval is expected to be close as well, but several lawmakers predicted that the FSX deal will ultimately prevail because opponents do not have enough votes to override a presidential veto.

Even so, "the Japanese government and industry would be well-advised to take our debate as a warning that the economic and commercial relationship [with the U.S.] must change substantially for the better," said Sen. Claiborne Pell (D-R.I.).

FSX fighter deal is seen by some as technology gift to Japan

agreement states more broadly that "Japan will receive access to the source codes necessary to develop the mission control computer."

Clyde V. Prestowitz Jr., trade analyst at the Carnegie Endowment for International Peace, located here, said the re-

## Tron inventor decries growing U.S. fear of Japan infiltration

BY LORI VALIGRA  
CN NEWS SERVICE

**TOKYO** — Ken Sakamura, the Tokyo University professor who started The Real-Time Operating System Nucleus (Tron) project, says the Japanese are sick of Japan-bashing.

"In the current climate of trade friction, anything new and Japanese is immediately considered an economic threat to certain countries," he said at a press conference here earlier this month.

Tron is a university-corporate cooperative effort aimed at creating a standard for computers and software used in applications ranging from intelligent homes to factories.

Tron has been named as an alleged market barrier by the U.S. in recent trade actions, partly because the project's standard is being considered for adoption by Japan's Ministry of Education. The market for educational personal computers is virtually untapped in Japan, and U.S. PC makers have complained in the past that Tron may be the next trade-war front if they are locked out of that market.

But the Japanese education market is not the U.S.'s only concern. Despite their general inability to penetrate Japan's market, one area in which U.S. semiconductor makers have fared well is microprocessors. Indeed, Motorola, Inc. and In-

tel Corp. dominate the market, and few Japanese microprocessors — with the exception of those made by NEC Corp. — challenge that dominance. If Tron processors are widely adopted, they threaten to chip away at the market lead U.S. makers now enjoy. The 32-bit version of the Tron chip design now being used by three Japanese chip makers is one of the most highly integrated microprocessors developed to date, Sakamura said.

**Tron as a worldwide standard**  
Sakamura's intention is to have Tron widely adopted as a worldwide standard for computers, which affects all facets of home and city life, including buildings and roads.

He is quick to point out that Tron is not merely a Japanese project: Among its participants is IBM Japan Ltd., which is working on several Tron computers. Also, early Tron computer models use Intel microprocessors.

"Tron will create a worldwide hardware and software market," Sakamura emphasized. "So Europeans and U.S. makers will be able to make products to penetrate the Japanese market. Software designers can make programs that can be translated easily from one language to another." He said that Tron has Japanese Kanji ideograph-handling ability embedded in the operating system's design, which makes such translations easy.

## Unlocking mainframe resources.

# Is your IBM mainframe keeping things from your end users?

Trax Softworks has a complete line of software to give end users immediate, secure, controlled access to IBM mainframe data.

**Spreadsheets:** ESS® powers a complete end user decision support system with 3-D capability, online help, and PC-like controls.

**Word Processing:** EdWord® is menu-driven and has flexible page preview, easy formatting, and a host of other essential WP features. Any 3270 user is ready for EdWord.

**Desktop Management:** TopNotch® gets end users organized with pop-up windows for note creation, mini-spreadsheets, electronic mail, and other office-of-the-future benefits.

**Non-IBM data base access:** VM DialOut™ puts 3270 users in touch with non-IBM systems and external dial-up computer services through a simple dial-out procedure.

More than 500 companies worldwide are using these fully supported Trax products individually or in combinations. Find out how they can help unlock IBM mainframe resources for your end users. Contact Tom Cox, Trax Softworks, Inc., 10801 National Blvd., Los Angeles, CA 90064. FAX: (213) 470-2487. Telex: 350048. Telephone: (213) 475-TRAX.

EIS, EdWord, TopNotch, and VM DialOut are trademarks of Trax Softworks, Inc.

Unlocking end user productivity on your IBM mainframe.

## THE PERSPECTIVES CONFERENCE

Computerworld Perspectives  
is the Executive Conference on  
Strategic Information Management  
designed to give you & your company  
answers on Strategies, Productivity & Standards.

This conference confronts the critical issues facing your IS team.  
Be prepared for the future. Join us.

June 20-21 New York City

Conference topics include:

Multi-vendor Integration, The State of Expert Systems,  
Network Management, Software Solutions, Security,  
Decentralization vs. Centralization, The Value of IS Investment,  
The Dollars and Sense of Downsizing, MIS as a Profit Center,  
The Office of the Future, MIS in the 1990's, The Customer as  
Partner, The Role of the Mainframe in the Future,  
Global Networking, Legal Options and Issues for IS

Featured speakers include:

Shoshana Zuboff, Michael Hammer, Donald Burr,  
Larry DeBoever, Ed Mahler, Tom Malone, Vaughan Merlyn,  
Donn Parker, Dr. Larry Harris, Ron Brzezinski, Tom Donovan,  
Bill Dunn, Mike Sullivan-Trainor, Stewart Brand, Charlie Lecht,  
Richard Bell, John Fisher, Jack Bologna, Dave Van Lear,  
Bill Howard, Mike Kaminski, John Burton, Larry Chimerine,  
Hank Jones, Robert Badal

Call Rhonda Radliff for further information at  
(508) 935-4565 or (508) 875-5000, Ext. 4565

Conference attendees are also invited to the  
Computerworld Smithsonian awards presentation.

# COMPUTER CAREERS

## Conversion experts in demand

*IS professionals often lack the skills or desire for systems changeovers*

BY SHERYL KAY  
SPECIAL TO

An information systems organization takes advantage of new offerings in hardware, operating systems and programming languages, they face a growing need for systems professionals who can help them move systems from one platform to another. Rather than develop new systems from scratch to accommodate new technology, companies convert existing systems to run on the new platform.

"If they have four million lines of code worth \$25 million or so to redevelop, where a conversion may cost in the \$2 million dollar range, why throw the old code away?" asks David Marshall, manager of technical support at Neometrics, Inc. in Des Plaines, Ill., a consulting firm that specializes in conversions.

Companies facing a conversion often tap consulting firms to do the work rather than hire experienced specialists or train in-house staff to handle a one-time undertaking.

Conversion specialists earn attractive salaries, according to managers at several of these consulting firms. A program manager/analyst with three years of

experience that includes conversion work might earn as much as \$33,000 a year. A systems analyst with five or more years of migration experience may take in more than \$50,000 a year.

### Five-step process

In brief, conversion specialists go through five steps during a migration, according to consultant Ron Horsey at Commercial and Industrial Systems in Boston.

The first step is to gather information and documentation on the existing system; develop a plan to move to the target system; code the conversions and conduct tests; switch to the new system and train personnel in its features; and finally, correct any lingering problems.

The breadth of conversion work can make it highly stimulating, not to mention fast-paced, according to Alice Babcock, manager of conversion operations at Teco Technologies, Inc., a consulting firm in Tampa, Fla.

"What's exciting for my team is that we convert our entire clients' shop, not just one application, so there's no time to get bored," Babcock says. While some aspects of conversions require him to learn at least 30% of the work is different with each customer, she adds.

Marshall says that because of the nature of their work, conver-

sion consultants sometimes are admired by members of the in-house staff. "Generally, when a company is converting to a system, they don't have a great deal of knowledge of the target system," he says. "A conversion specialist, who may also be an average employee in a shop that already uses the target computer, gets to be viewed as an expert at

the site."

But conversion specialists also are viewed with condescension, according to George Hathaway, practice leader for strategic systems development at the consulting firm Index Group, Inc. in Cambridge, Mass. Performing conversions is not viewed as a particularly glamorous calling, perhaps because the specialists are not necessarily creating new systems, he says.

Furthermore, it is rare to find systems professionals who have learned more than one hardware platform, operating system or language, Hathaway says.

"There are many people in our business who would rather main-

tain the status quo and continue with what they know best rather than learn something new," he says. For these reasons, most consultancies will hire professionals who do not have conversion experience, assuming they possess certain technical knowledge and personal characteristics.

From the technical standpoint, employers agree that serious contenders for a particular position must have a thorough understanding of the target system as well as some exposure to the platform currently in use.

"In my 15 years, I've been involved with conversions from Germany to Hong Kong and even one in Shanghai," Marshall says. However, most U.S. consulting firms specializing in conversions find enough work in the U.S. to keep their people busy.

### Learning through doing

Learning conversion methodology is difficult, and the consensus among employers is that the best way to learn is through hands-on experience. Because most employers are willing to train the professionals they hire in migration techniques, they present an exceptional opportunity to acquire highly sought-after skills without having to attend classroom training.

Such knowledge may be of value to systems professionals in general, according to Larry Azevedo, a program manager at Online Software International, Inc. in Cromwell, Conn. Azevedo notes the widespread praise for open systems architectures and distributed data management, under which an organization may use systems from several vendors.

If these practices become as popular as some people predict, then systems professionals should become familiar with as many platforms as possible even if they do not choose conversions as a career path, he says.

Conversion projects, which tend to span six to nine months, can be located around the world.

**T IS RARE** to find systems professionals who have mastered more than one hardware platform, operating system or language.

On the personal side, dedication and determination are important because conversions must be completed within a certain time frame. There is no time to become intimate with each application being converted, according to Babcock. "A conversion specialist can't get whipped — he can't give up," she adds.

Conversion specialists also should be attracted to certain situations, according to Hathaway. "It's the person who sees almost impossible situation and says, 'That's the one I want to tackle,'" he says.

Conversion projects, which tend to span six to nine months, can be located around the world.

# "The bottom line is results. What I'm seeing, thanks to Computerworld, is beyond our expectations."

— Max Steiner  
Director of Marketing  
Kenda Systems, Inc.

**M**ax Steiner remembers his days as a salesman, when he would make calls and, invariably, see a copy of Computerworld on the desks of his clients. That alone made an impression on Max.

Today, he is Director of Marketing for Kenda Systems, a software services firm with offices in New England, New York and Washington, DC, and specializing in placing contract engineers within the high-tech industry. Having grown by 400 percent annually for the last three years — and having placed several hundred professionals in less than three years, Kenda Systems is an acknowledged leader in the industry.

The impression that Computerworld has made on Max early on has been a lasting one. He directs Kenda's advertising. And he directs it to Computerworld.

"We are looking for national exposure. First, we want to make people aware of Kenda Systems and then increase the number of resumes sent to us. I believe that greater recognition will lead to greater interest — and understanding of what we can do for people.

"It only follows that we can best accomplish our goals by advertising with the industry leader — it answers all our needs. Computerworld reaches the qualified software professionals we're looking for.

"And we have the proof. We've seen as much as a 30 percent increase in resumes coming into our offices. Plus we're getting everything we hoped for: national recognition and responses from top people from all over the country. Clearly, we're quite pleased with the results.

"We're hearing from software engineers who are impressed with the fact that Kenda's in Computerworld. The bottom line is results. What I'm seeing, thanks to Computerworld, is beyond our expectations."

Computerworld. We're helping serious employers and qualified information systems, communications and PC professionals get together in the computer community. Every week. Just ask Max Steiner. For all the facts on how Computerworld can put you in touch with qualified personnel, call your local Computerworld Recruitment Advertising Sales representative today.

## The Beautiful Roanoke Valley of Virginia

### Our People-Oriented Environment

This is no "impersonal" "shop." On the contrary, we are an organization designed specifically to recognize and meet your needs, dedication, contributions, that encourages you to learn, achieve and advance with us.

### Outstanding Opportunities For:

- TEAM LEADERS
- SYSTEMS ANALYSTS
- TECHNICAL PROGRAMMERS
- SENIOR PROGRAMMER ANALYSTS
- PROGRAMMER ANALYSTS

These positions offer excellent growth potential for dynamic, capable individuals. You will provide support on a variety of projects, ranging from those within our rapidly expanding department. To qualify, you must have a Bachelor's degree in Data Processing or Information Systems, plus three years experience in systems analysis, increasingly responsible data processing experience utilizing the following:

<input type="checkbox"/> VMS	<input type="checkbox"/> JCL
<input type="checkbox"/> MVS	<input type="checkbox"/> CICS
<input type="checkbox"/> OS/VS	<input type="checkbox"/> VSAM
<input type="checkbox"/> Oracle	<input type="checkbox"/> COBOL
<input type="checkbox"/> Ingres	
<input type="checkbox"/> DB2/NET	

### Virginia

Remember when commuting took only a few minutes? When the cost of housing was less than unimportant? When the quality of life was better than you imagined? That is why so many people have chosen to live in the Roanoke Valley. Blue Cross and Blue Shield of Virginia (BCBS) is located in downtown Roanoke. The area offers impressive recreational and cultural opportunities within only minutes from the mountains and six states of the Blue Ridge Mountains and Shenandoah Valley. Join us and decide a little more about what makes you really want and much more about what you need.

You may apply by forwarding your resume to:  
George Thomas, BLUE CROSS AND BLUE SHIELD OF VIRGINIA, 802 S. Jefferson St., Roanoke, VA 24010.

Blue Cross and Blue Shield of Virginia offers highly competitive salaries and a comprehensive benefit program. An equal opportunity affirmative action employer.

### DATA PROCESSING PROFESSIONALS

**Small City Lifestyle.  
Big City Technology.**

### CAREER OPPORTUNITIES

When you join Computer Horizons, you can have the best of both worlds: a small town atmosphere and the opportunity to work in and contribute to one of the most dynamic and exciting industries in the world—data processing and computer technology. We currently offer exceptional career opportunities with fast-paced achievement waiting for you in Charlotte, NC; Waycross, GA; Atlanta, GA; Birmingham, AL. (Positions also exist in other small cities throughout the Southeast.)

We're one of the most dynamic D/P consulting firms in the country with 31 state-of-the-art facilities and sales in excess of \$60 million annually. With us, you'll be an important part of our highest caliber professional team. With top-notch training, excellent compensation, and a unique combination of technical and business management for our impressive Fortune 500 clients. We'll give you all the support you need with the best technology in the business and a challenging career—because when your environment leads to the future, so can you.

If you're an advanced systems professional with significant DEC/VAX experience and a background as mainframe hardware, we're very interested in you. You must have experience in one or more of the following:

- VMS
- MVS
- OS/VS
- Oracle
- MAC/Apple
- Macro VAX
- DEC/VAX
- DCL

In fact, at the present time, we offer some average salaries, a complete benefits package that includes health, life, dental and disability insurance, unlimited vacation reimbursement, as well as our deserved income plans (401K), tuition relocation assistance and the chance to secure your future in an established, ever growing industry in the most progressive company.

Please contact us by calling or submitting your resume to:

### SENIOR DATA BASE ANALYST

A leading producer of enamel papers for the printed communications industry has an immediate opening for a Senior Data Base Analyst. The selected candidate, reporting to the Data Base Manager, will physically implement software and data bases and serve as a resource person. This person regularly carries out complex projects under general supervision and may act as a project leader in some assignments. Duties include: design, develop, test, research, implement and maintain all DBMS software and all software directly related to the use of the DBMS. This individual will analyze requirements, plan and design data bases and control their use. Data Base Analyst must have:

B.S. degree in computer science or a related field and a minimum of 5 years of data base management experience. Experience on IBM mainframe in CA-DATACOM, CA-OPTIMA, CA-DATA DICTIONARY, CA-DORY, and CA-DEAL preferred. Experience with DB2, SQL, other relational data bases and data analysis will be considered. Our office in Wisconsin Dells offers an excellent working environment, great outdoor recreation and a generally friendly environment. Excellent employee benefits and a liberal relocation program. Send resume and salary requirements to:

### Today's Blue Cross and Blue Shield of Virginia Government and Individual Business Center

If you are among the best in your field—whether you are actively seeking a new position or not—we'd like to tell you that there is a place for you in the Blue Cross and Blue Shield of Virginia. Your search for a new challenge and opportunity is simple; we can show you the D/P career further. Either Blue Cross and Blue Shield of Virginia is recognized as one of the most dynamic and successful companies in the industry. As a result, Information Services (IS) experienced a period of impressive success and continued growth. Much of this growth is occurring in IS operations in connection with new computer installations and a dynamic new vision. The future looks brighter than ever. That's why there's no better time for the best to join us than right now.

### Our Advanced Technology

We are committed to staying at the forefront of today's technology and constantly integrating new technologies as they emerge. We feature a sophisticated, large-scale IBM system with a capacity of 1.5 million records per second. Utilizing CICS and IMS, Information Services is expanding CASE tools set and actively pursuing the application of artificial intelligence and image processing to better serve our users throughout the organization.

### Higher Levels of Responsibility and Visibility

The company realizes that Information Systems is key to our success. That's why the spotlight will often be on you. You will be assigned to work with a wide range of clients, from small businesses to large corporations, providing support not only as a technical person, identifying and implementing the solutions that will best assist our users in meeting their business needs.

**This is Today's Blue Cross and Blue Shield of Virginia**  
Government and Individual Business Center

### We're looking for innovative Software Engineers with technical talent, determination, and business savvy...

A piece of paper doesn't fly on its own. It takes careful trading and cutting to get an aerodynamic shape. It's the same with a new idea.

It takes insight, thought, and careful planning to make it successful.

As a member of the prestigious GE Consulting Services family, our consultants have applied the kind of insightful expertise and creative processes to solving complex problems that have made some of Fortune's top names:

New and exciting projects in Western New York and Western New England have opened up opportunities for the creative IT minds of the world. If you have the desire to work with others, and make it work, combined with 1+ years of experience in one of the following fields, we would like to meet you:

**MINIMICRO**  
VMS  
UNIVAC  
PDP/11  
LISP  
PL/I

...who have the ability to  
make creative solutions

fly

**MINIMICRO**  
INTEL PLM  
UNIVAC C, C++  
WINDCHILL  
HONEYWELL  
FORTRAN  
DATA GENERAL  
Advanced degree- Eng/Biz

Additionally, we will consider talented software engineers and computer specialists with advanced degrees.

We have exciting projects that will challenge an excellent total compensation package, and encourage your creativity. Plot your career in a new direction, and send your resume to:

# MARKETPLACE

## IBM's System/36 still kicking

*Reluctance to convert to AS/400 stimulates secondary marketplace*

BY TONY MEMBRINO  
IDC FINANCIAL SERVICES CORP.

Activity in the System/36 5360 secondary marketplace remains brisk. This status is not bad for a product line that was replaced by the Application System/400 last year and is celebrating its sixth birthday this month.

The following factors explain why activity remains strong in the System/36 used marketplace:

- The conversion from a System/36 to an AS/400 has been an arduous and time-consuming process for some users. Therefore, System/36 end users have been fairly hesitant about moving to the AS/400.

- The existing System/36 base can grow sufficiently with the System/36 via upgrades, so users do not yet need the additional capacity that the AS/400 provides.

- The cost of converting to an AS/400 is substantial.

IBM is certainly doing its part to entice System/34, 36 and 38 users to the AS/400. For users

of the 5360 and 5362, IBM will discount the AS/400's operating system, OS/400, by 20% for customers who order an AS/400 before Sept. 30 and have it installed before Dec. 29. In addition, IBM is offering a 30% reduction of the one-time or primary license charge for selected software programs.

If these programs prove successful for IBM, users can expect to see a greater supply of 5360 and 5362 machines during the fourth quarter of 1988.

**Strong upgrade demand**

According to IDC Financial Services Corp., a third-party contact, the majority of these machines is centered on upgrading existing 5360 systems. The demand for additional System/36 processors, however, has picked up since the fourth quarter.

Some System/34 users, as well as 5362 users, have opted to go to the used marketplace and acquire 5360 processors instead of migrating to the AS/400. In addition, a few 5360 customers

have taken on more of these machines to satisfy their processing requirements.

Secondary market trading of System/36 machines during the fourth quarter of 1988 was ac-

celerated by the 200M-byte models. This market situation is the result of two factors: the strong demand from existing System/36 users to increase disk capacity and limited availability of the 358M-byte drives on the secondary market. Through the addition of 358M-byte drives on a 5360 Model D2K, users can increase total disk capacity to 1,432M bytes, a 79% increase

over what the 200M-byte drives can deliver more quickly than IBM. With the exception of the popular 5363, the System/36 is in limited production and delivery delays of 60 days and longer are not unheard of.

Many secondary market contacts are anticipating that the demand for 5360 upgrades will remain strong through the rest of the year.

For more information, contact IDC Financial Services Corp.'s Terri LeBlanc at 508-872-8200.

## MANY SECONDARY market contacts are anticipating that the demand for 5360 upgrades will remain strong through the rest of the year.

tive, and values remained stable. Since January, used 5360 Model B processors have shown 200M-byte drives that have declined in value. In January, a 5360 Model B23 was listed at \$11,900. The same machine in early May was retailing for \$9,400, a 21% decline. Both the machine and drive are readily available, and demand has been good.

Used values for 5360 machines that have 358M-byte drives — mainly the D2K, D2L, and D2M models — have fared

over the capacity achievable with the 200M-byte drives.

To attain more than two 358M-byte drives with an existing Model D2K system, an additional trailer must be purchased. The trailer has been a hot item on the System/36 used market since the beginning of the year, and users are paying a premium for both the 358M-byte drive and the trailer.

While prices may be inflated for the 358M-byte drive and its trailer, users have been paying the prices because the second-

# TRAINING

## Training changes in the 1990s

*A heavier load calls for burden sharing and greater automation*

BY BILL SHERRELL  
SPECIAL TO CW

Training budgets are high, and when considering the work time that is lost because of training, the costs are even greater. But training is not getting any cheaper, nor is it getting any easier. If recent studies are correct, the 1990s will see a growing number of entry-level workers who are functionally illiterate and will require extensive training.

In addition, technical workers already on board are going to require even more training to utilize the productivity tools that are becoming available. Employers, of course, will be expected to bear that training load.

The situation is not hopeless, however. There are some potentially feasible answers to the problems. The partnership be-

tween employees and employers today is not so rigid that it cannot be shifted to a more productive relationship.

Historically, when an individual in MIS was hired, it was frequently stated or implied that the company would provide training and the training would be delivered during company time.

One mutually beneficial alternative—a new partnership—is for the company to allow the employee to select and determine the pace of training to take place both within and outside of the normal work day.

Since both parties benefit, this solution is not unfair. Furthermore, companies will have to modify how the training is delivered. Currently, the most effective vehicle is the stand-up lecture.

Companies should begin to automate selected portions of to-

day's training to get ready for the future. Educational technologies such as interactive video, computer-based training, satellite and cable television courses, audio conferencing and even videotape can be upgraded from specialized, secondary status to complementary and eventually primary means of delivery.

Consequently, automated training does not begin to compare to the stand-up lecture in terms of quality and development costs. In most cases, the automated delivery has not lived up to expectations.

There has to be a slower, more workable transition than the radical abandonment of the traditional lecture that we saw with the early introduction of media. It is necessary to shift to the new technologies in a planned and orderly manner in time to counter the difficulties of the next decade.

There are some relatively inexpensive, generic courses commercially available that use the automated delivery techniques. These courses have not been particularly successful as stand-

alone teaching tools, nor have they been readily accepted by the technical community.

If these self-study courses are selectively combined with instructor-led workshops tailored to an organization's unique applications, time in the classroom will be reduced considerably, and costs will be reduced as well.

More importantly, in some pilot offerings, students have generally liked the type of delivery. Total training time has been reduced, and the training objectives of both the organization and the students have been met. A large insurance company recently conducted such a pilot program to teach IBM's MVS program using interactive video followed by a workshop of stand-up lectures.

### Cost cutters

With this type of transitional delivery, development costs are not excessive and may even be reduced. Delivery costs certainly are reduced significantly. The problem of not being able to place students in the right training course at the right time is at least partially averted. Employers can begin to manage their own training time, problems can be minimized, and quality can be measured through the testing that is inherent in media delivery.

The transition to greater use of automated delivery can be accomplished without any abrupt or traumatic changes in the organization.

One disadvantage to such a trend is that companies must provide more and easier access to the necessary training devices and media courses so that people can manage training time more effectively.

Recent graduates entering the work force today do not appear to see many problems with the concept of a partnership. They may have been exposed to this type of training in college and secondary school. People who are already employed, on the other hand, are going to face some adjustments that they may not be comfortable with for a while.

The bottom line is that it will be too expensive to continue the current method of training. The transition to a media/workshop form of delivery begins to address the issues of the 1990s so that businesses can take steps toward more automated training as the appropriate tools and techniques become available.

*Despite less-than-glowing news, technology issues stay strong*

The computer industry market "is clearly picking up," Needham & Co. analyst Barbara Lagger noted last week. "Maybe it's the improved economy, maybe it's just spring, but there's definitely a renewed sense of excitement." So much so, Lagger said, that even Hewlett-Packard Co.'s 24-point slide to a Tuesday close at 54% following a disappointing quarterly earnings announcement did not shake the general confidence. Neither did Cray Research, Inc.'s loss of 314 jobs in the wake of its announcement that it will soon split into two separate computer companies. Cray closed at 42%.

Computer Associates International, Inc. reported robust earnings and profit for fiscal 1990 and picked up 3% points, closing Thursday at 41%. Microsoft Corp. rose 3% after announcing an enhanced OS/2 and announcing its intent to offer software integrated with IBM's Officevision. IBM itself gained 14 points on the strength of last week's Officevision debut; its stock closed Thursday at 112. Digital Equipment Corp. advanced by 97%, up 1 point. Compaq Computer Corp. gained 34% points to close at 83. Sun Microsystems, Inc. closed at 10%, up 14%.

WILL MANGOLIS

# Debuts have OS/2 in common

BY ROBERT MORAN  
CW STAFF

A dozen independent software vendors showed up for IBM's announcement last week of products that, ironically, were more notable for their commonities than for their distinctions.

Not all the vendors offered applications that melded with IBM's Officevision. However, each demonstration showed the powers of IBM's OS/2 Extended Edition to bring the economics of the workstation to the local-area network to largely mainframe-based applications while giving corporations and their users the common look and feel of applications from IBM's Presentation Manager and Common User Access.

Paul Hensinger, president of Computer Task Group, Inc., a consultancy based in Buffalo, N.Y., said that Officevision is not as critical to vendor offerings as is the applications' presentation. "Companies will buy products that aren't part of Officevision," Hensinger said, "but vendors with applications that don't have the appropriate look and feel will have a tough time selling products."

Despite the commonalities,

some vendors are closer than others to bringing out products. Comshare, Inc. in Ann Arbor, Mich., announced a new version of its Commander Executive Information System (EIS), expanded for office automation applications and LAN support.

Features include the ability to build executive briefings books and send or receive electronic mail and integrated screens via IBM Professional Office System or Officevision.

Commander EIS will be available in the fourth quarter. Depending on the implementation, prices range from \$48,000 to \$300,000.

Similar features tailored for human resources management will be available this summer from Tessera Corp. in San Francisco. The company announced HRMSs integration, which will provide users with the capability to, for example, send payroll information across an electronic network to appropriate personnel for action. Prices begin at \$28,000.

Integral Systems, Inc. in Walnut Creek, Calif., introduced HR Minder, the first component of its HR Vision software that geographically distributes human resources and payroll management across all IBM Systems

management system. Both Management Science America, Inc. in Atlanta and McCormack & Dodge Corp. (M&D) in Natick, Mass., have embraced cooperative processing for their financial and human resources applications, and both firms are tooling their products for release in the second quarter of next year.

MSA announced that Brightview cooperative processing software, introduced last November, will be enhanced with pull-down menus and pop-up windows based on the presentation manager.

Brightview is scheduled to be available in the second quarter of next year.

M&D's Millennium Workstation allows users to access information from separate databases — including DB2 and VSAM — and analyze the information using SQL without regard to the source. Officevision is already integrated with the product.

Information Builders, Inc. in New York introduced PM/Focus, the Presentation Manager version of its fourth-generation presentation management system, for the workstation and the LAN. The new release is slated to be available in second-quarter 1989 and features tool sets for reporting, graphics, statistics and spread-

sheets.

Sterling Software, Inc.'s Answer Systems Division in Canoga Park, Calif., introduced Presentation/Answer cooperative processing software that allows users to extract, summarize, reorganize and download data from across numerous databases on the mainframe. Presentation/Answer will reportedly be available by mid-1990.

Prices, including mainframe and PS/2 software components, range from \$18,000 to \$56,000, depending on mainframe configuration.

Other vendors that announced Officevision-compatible products include the following:

- Arthur Andersen & Co. said its Mac-Pac and Mac-Pac for the Application System/400 — management control packages for manufacturing engineering and materials planning — will be out the second half of next year.

- American Management Systems, Inc. in Arlington, Va., announced two government financial applications, a university financial application and a program for customizing telephone bills.

- American Software, Inc. has its Inventory Control and Accounting software is slated to be available the first quarter of 1990.

- SAS Institute, Inc.'s statistical and data analysis software is being developed for the first quarter of 1990. Prices have not been set.

## Brightview lauded as MSA users get first view

BY AMY CORTESE  
CW STAFF

ATLANTA — Management Science America, Inc. is alive and well, if last week's user's meeting was any indication. The 4,000 customers gathered here for the annual conference applauded MSA's recovery from its financial troubles and lauded its work on Brightview, MSA's first implementation of IBM's Systems Application Architectures (SAA).

Although Brightview — a cooperative processing software package — hasn't been shipping for a month, many MSA customers were seeing it for the first time at the Interact conference. While most expressed enthusiasm for Brightview — and SAA — their time frames for implementation varied greatly.

"The thrust is to go to Brightview," said Otto Walker, manager of corporate systems at Blue Cross of California in Woodland Hills. But the company is performing a feasibility study to determine whether to convert from an IBM AS/400 environment to a CICS environment, which Brightview requires, he said.

Similarly, Ronald Moore, as-

sistant vice-president of information systems at Merchants Service Corp. in Indianapolis, said that while SAA will be important, right now his bank has "a lot of [IBM] 3170 terminals out there." Moore added that as the bank migrates to PCs, Brightview will be considered.

Robert Schwartz, a software consultant at a small oil firm, said his company is moving full-speed ahead with SAA and that Brightview will be a part of that.

**Good direction, bad price.** Regardless of when they plan to implement Brightview, customers agreed it was a good direction for their organizations and for MSA. "Clients are frustrated with screens so crammed with data," Schwartz explained.

But for many customers, cost is still an issue. At the product's announcement in November, MSA reported license fees of \$25,000 per module for up to 50 users — which could easily add up for customers with a full set of MSA applications.

Schwartz said for a large firm like his, that equals the cost of one programmer, but others were put off by the hefty price tag.

## Migration

FROM PAGE 1

standard is always changing and may never reach a final form.

- Comsoft currently runs IBM's Professional Office System (POS) as a worldwide network in which his Digital Equipment Corp. VAXes participate.

- Comsoft said he was trying to switch WordPerfect Office as a corporate standard but will now examine Officevision as an alternative.

- Other users with existing electronic mail systems also pondered the migration question. "We're not sure whether we will replace Profs with Officevision," said Jack Melton at Ryder Truck Rental, Inc. in Miami.

- Melton and Ryder is part of an SAA "head start" program in which the company has been advising IBM on SAA features. He said it is likely that Ryder will move to OS/2-based workstations and Officevision in about three years.

- Ryder's corporate systems include IBM mainframes, AS/400s and PS/2s. Melton said MSA could implement Officevision on AS/400s, si-

though he added that when he tried Office/400, it degraded performance.

Walton Zilsky, second vice-president of data processing at the Travelers Corp. in Hartford, Conn., said Officevision alone will not justify OS/2 LANs.

- "We won't move to OS/2-based LANs because of Officevision but because of lack of opportunities," he said. It would be a financial, customer service or other application that would warrant the move, he said.

- However, Zilsky said he is interested in examining Officevision/MVS as a replacement for Personal Services/CICS as a mainframe application. He said half of Travelers now uses that E-mail package while the other half uses a Travelers proprietary package.

- Inside Casting, Inc., MSA director of Research and Development Corp. of America's Manufacturing Technology Center in Wichita, Kan., said the pricing of Officevision is attractive. The hospital had been looking at an E-mail package from another vendor priced at \$50,000 for its IBM 3090 Model 120E.

With 300 terminals and 150 PCs, the hospital could implement Presentation Manager-style interfaces in some administrative areas. "They're the ones that need graphs and E-mail," Castillo said. Users in other departments could use personal computers or terminal screens, she said.

Jean Downs, senior vice-president of management services at Barclay's American Corp. in Charlotte, N.C., said a move to Officevision is not in the cards at his organization for at least 18 months.

Barclay's currently uses Wang Laboratories, Inc.'s VS minicomputers for E-mail. Networks of IBM personal computers and IBM-compatible PCs from Wang are connected to the Wang system and to an IBM mainframe.

Barclay's is performing an office automation study and has determined the total cost of an integrated Wang E-mail system is about \$55,000 per user, which is \$3,000 less than the \$58,000 quoted by IBM for a system with a Presentation Manager appearance. "I'm not convinced that the Presentation Manager is necessary," Downs said.

# IBM fully backs LAN Manager, Ethernet

BY PATRICIA KEEFE  
CW STAFF

**NEW YORK** — IBM hemmed and hewed its way into clearing up two major long-standing contentious issues in the last week: Users can expect full support of key OS/2 LAN Manager application programming interfaces (API) and raw Ethernet technology.

This means that users on IBM OS/2 Extended Edition workstations running Officevision will be able to use resources on Microsoft Corp. LAN Manager-based servers, IBM and Microsoft said. Conversely, LAN Manager workstations will talk to IBM's OS/2 LAN Server.

Cheryl Currid, director of applied information technology at Coca-Cola Foods in Houston, predicted that current users of Novell, Inc. and 3Com Corp. networks will quickly move to IBM's OS/2 Extended network platform via either LAN Manager or Named Pipes API support or third-party gateways. She oversees an IBM Token-Ring network running Novell's Inc.'s Netware and plans to move to Netware 386.

#### Top stories

Ethernet support means that OS/2 Extended workstations on Ethernet will eventually be able to tap into IBM's Systems Application Architecture (SAA) environment. For users in mixed environments, such support is long overdue.

"It's definitely of interest to us, because we are heavily dependent upon Ethernet," said David Lee, manager of database technology and product systems at Houston-based M.W. Kellogg Co. His systems team, previously Digital Equipment Corp. VAX-based, but Kellogg is interested in running IBM software on its existing network and achieving tighter integration between IBM and DEC systems.

The formal announcement regarding LAN Manager actually came from Microsoft, a LAN Manager co-developer along with 3Com, and was confirmed by IBM. Officevision, IBM's first SAA application, takes advantage of Microsoft network technology in three areas:

- IBM's OS/2 Extended Version 1.2 will support 13 categories, or 87 LAN Manager APIs. This includes Named Pipes.

- Officevision will use the IBM Extended 1.2 LAN Requestor based on LAN Manager technology, Microsoft said.

- OS/2 Extended 1.2 will support Ethernet adapters written to the Microsoft/3Com Network

#### Driver Interface specifications.

IBM is expected to unveil support for specific third-party Ethernet adapters next week, including those from 3Com, Unisys-Bass, Inc. and Western Digital Corp., sources said.

#### Users in no rush

Despite the announcement over the Officevision LAN and the connectivity enhancements to OS/2 Extended 1.2, early feedback indicates a slow move to IBM's new network platform.

Much of the Fortune 1,000 is either in the process of choosing between Netware or IBM as their network standard — such as McKesson Corp. in San Francisco — or already has sizable LAN bases installed that cannot be jettisoned.

"The thing that makes me so犹疑 is that those of us into Netware and 3Com have millions invested in hardware, software, training and people, and just because of one announcement, you can't just corporate America that quickly," Currid said.

Chase Manhattan Bank in New York has already begun to migrate to OS/2 Extended and SAA is "definitely on our plate," said Ken Luke, vice-president of communications, citing an installed base of Application System/400s and an interest in the 16-bit Token-Ring. However, Luke continued, "We have a couple of Novell and Bayan LANs, and there appear to be some interests there."

If IBM's offering can meet security and performance criteria, there is a chance that Chase Manhattan will replace its Netware investment, Luke said.

While costs are not major issues for either Luke or Chase Manhattan, another Netware user — many users were taken aback at the price — may leave the price between today's MS-DOS and IBM Personal Computer AT bus-based LANs and IBM's new platform.

For example, MS-DOS requires perhaps 2.5 MB of memory, while OS/2 Extended recommends 8 MB bytes. Users used to paying up to \$1,500 for a workstation will have to shell out \$7,000 for a Personal System/2 Model 70. At minimum, IBM has doubled the cost per node.

"You're talking about roughly a \$7,500 price tag to get an intelligent workstation that will run Officevision," said Hal Bernstein, an information center specialist at John Hancock Financial Services. Migration will happen gradually, perhaps by the end of 1990; meanwhile, "IBM will have to come down in its pricing," he said.

# Officevision, OS/2 in limelight

BY DOUGLAS BARNEY  
CW STAFF

**NEW YORK** — The OS/2 operating system has finally captured the attention of IS. All it took was a solid show of cooperative processing support from IBM and the third-party community.

OS/2 and particularly the IBM proprietary OS/2 Extended Edition, grabbed the spotlight last week with Officevision. The net of two announcements: IBM announced support for OS/2 Extended on local-area networks, server to provide users with seamless access to IBM midrange and mainframe computers; OS/2 Standard Edition and DOS-based PCs can also tie into Officevision but offer more limited user applications. More than a dozen third parties also rallied around the flag with announcements of products that support OS/2 Extended (see story page 119).

Users said the announcements boosted OS/2's stock by finally displaying applications that take advantage of multiprocessing and large memory. Until now, most OS/2 applications have been warmed-over DOS applications.

To further boost the allure of

OS/2, IBM announced new features, including a high-performance and more flexible installable file system.

For its proprietary OS/2 Extended Edition Data Manager, IBM announced multiserver access, plans to tie in PC-DOS applications, referential database integrity, a graphical query manager and added language support including Cobol, Fortran, Pascal and PL/I. IBM could not clarify any benefits of using OS/2 Extended instead of Standard Edition applied on a workstation attached to an OS/2 Extended server.

**Users impressed**

The concept and the programs displayed by third parties are indeed a novel approach, users said. "These are the first true OS/2-based applications and also the first SAA-based applications," said Henswell Chou, second vice-president of Travelers Insurance, a division of The Travelers Corp.

"It certainly does change the stature and potential of OS/2," said Rich Luciano, a vice-president in the corporate banking sector of Manufacturers Hanover Trust Co.

The announcement of OS/2

applications does not ensure fast implementation. The products will not begin shipping until fall, and customers must cost-justify the move if they choose to move at all. "Officevision does not come out until September, and its real use won't be apparent for some time after that," noted Robert Metz, senior technical analyst for Whirlpool Corp.

Metz predicts his firm will begin to make a move to OS/2 in about a year, but he and others are troubled by OS/2 Extended's lack of device drivers, printers, monitors and communication cards. Without device drivers, OS/2 Extended and Officevision may shut out clones from its network.

"It is all wrapped around proprietary hardware and software. You can't get around that," said Bob Schaeueler, director of information systems technologies at Rockwell International.

Being prompt is one thing; being ready to buy is another.

"We are very impressed with the added functions," said R. Bruce Johnson, a director of support services at a Wall Street law firm. "The question is, will the specific applications warrant a change?"

## SAA

FROM PAGE 1

with a standard interface into IBM's enterprise network puzzle as well as concrete reasons to buy into the so far unsuccessful LU6.2 and OS/2 game plan, analysts agreed.

To date, the cost and memory requirements of OS/2, as well as the difficulties in writing to LU6.2, have discouraged most corporations from venturing much beyond pilot projects. However, the introduction of Officevision crystallizes the key roles that both OS/2 and LU6.2 will play in uniting IBM's disparate hardware platforms from top to bottom.

Leading the way is the Officevision/2 LAN Series, which not only functions as the springboard into enterprise-wide SAA — enabling IS to regain control of unruly LAN implementations while delaying moves to larger minis — but also sets the stage for the beginning of the end of some time-honored IBM technology, analysts said:

- Professional Office System (POS) and Distributed Office Support Systems (Doses) mail, which will evolve into Officevision.
- Dumb 3270 terminals, which over time are expected to go to the way of the punch card.
- Stand-alone LANs, which now have an even greater incentive to connect to the enterprise.

• Intel Corp. 80286-based personal computers linked to 640K bytes of random-access memory, which are rapidly being overtaken by the power and capacity of IBM Micro Channel Architecture-based workstations.

Successive introductions during the last two weeks of both Officevision and Novell, Inc.'s Netware 386 give minis a one-two punch [CW, May 15].

"There's a big market of people who at some point in time might be candidates for a mini-computer-based system. But now I think they will look strongly at distributed networking," said consultant Andrew Seybold, president of Computer Insider, Inc. As a result, minicomputers may have their role reduced at the departmental level.

IBM's Profs are now "stabilized," according to Robert Lesniowski, director of product marketing of office software at IBM, meaning there will be no follow-on versions. Instead, Officevision VM is the successor software automation package.

In fact, "IBM is moving internally to Officevision lock, stock and barrel as fast as it can," said Judith Hurwitz, a senior consultant at Patricia Seybold's Office Computing Group.

At the same time, IBM is taking care not to traumatize its E-mail users, she said. As Profs evolves into Officevision, users will have a choice of migrating to a new interface or sticking with the old one, according to Hurwitz.

# IBM focus: Programming ease

BY ROBERT MORAN  
CW STAFF

Along with a dozen other software solutions designed to free professionals from burdensome programming, IBM unveiled last week the fruits of its technology arrangement with Metaphor Computer Systems, Inc., in Mountain View, Calif.

IBM Data Interpretation System (DIS) will allow managers and professionals to access local and remote IBM databases and build applications without extensive programming support, IBM said.

With the joint arrangement, IBM will offer DIS software—based on Metaphor's technology—on Personal System/2 Model 70s or Model 80s. The PS/2s will be interconnected on a 16-M-

byte IBM Token-Ring local-area network that communicates with other similarly configured LANs and IBM 370 hosts operating under MVS or VM.

Metaphor has built a reputation for its easy-to-use, intuitive programming tools. Armed with a mouse, professionals can build their own applications by linking capsules, which appear as icons on workstation screens.

The Metaphor system—a network of workstations and databases as well as file, communication and personal computer connection servers—allows professionals to interact with relational databases residing on IBM mainframes and various other systems.

Prices will vary according to configuration. Host Client Software will range from \$6,600 to

a Group 10 processor to \$40,000 for a Group 40 processor, IBM said. The LAN Services software, which will support about 20 users with fully equipped workstation tools, costs about \$135,000.

Metaphor now offers co-processors cards to convert IBM Personal Computers, XTs and ATs to DIS workstations. Chairman David Liddle said Metaphor will soon introduce a co-processor card that will let users adapt less expensive PS/2s than the Model 70 or 80.

Also announced was Executive Decision/VM, allowing the PS/2 to access operational data and external information sources and operate concurrently linked to the VM environment. Prices range from \$7,500 to \$45,000.

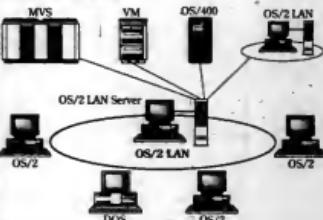

or vendors' network management systems as agents.

Computerworld asked from the demonstration were indications of how and when IBM planned to provide a method for users to issue common commands to non-IBM systems from the interface or collect facts from non-IBM devices into a common database. IBM has yet to announce such a database for its own devices.

"Netview has the same hole it had before: as inability to integrate non-SNA information," said Thomas McDonald, a principal consultant at Natick, Mass., consulting company MGT Technology Group. IBM's inability to demonstrate this capability even in a prototype is a crucial failing, given that several months ago, AT&T demonstrated how users can call up Netview as a window on their screen and control their network over telephone lines, McDonald said.

Despite the unfinished nature of 1-2-3/G, which gave it a heavy blessing, according to IBM materials, the deal was the result of the 10-year joint development and marketing agreement

**The IBM solution**  
Officewinder/2 LAN Series will link PCs running DOS and OS/2, while OS/2 Extended Edition systems will be able to interact with Officewinder products on other platforms

## Lotus' 1-2-3/G wins IBM backing at demo

BY DOUGLAS BARNEY  
CW STAFF

Although it was introduced more than two years ago, Lotus Development Corp.'s 1-2-3/G finally saw the light of day at last week's IBM Officewinder announcement.

Lotus provided a limited demonstration of 1-2-3/G, which runs under IBM's OS/2 Presentation Manager, to show off its so-called "Enterprise Spreadsheet" capabilities. The demo included the unshipped 1-2-3 Release 3.0 transforming data to the unshipped 1-2-3/M for macros, which then moved the data to the unshipped 1-2-3/G.

Despite the unfinished nature of 1-2-3/G, which gave it a heavy blessing, according to IBM materials, the deal was the result of the 10-year joint development and marketing agreement

## Cipher to revive tape drives

BY ROSEMARY HAMILTON  
CW STAFF

Cipher Data Products, Inc. is planning a comeback for the IBM Application System/400 market.

The tape drive manufacturer, which last year held a prestigious position as a reported AS/400 developer and then seemed to disappear quietly, will introduce a high-performance tape drive for AS/400 users in August, a company spokesman said.

The Cipher tape drive will be about twice as fast as what IBM currently offers to the AS/400 market and will sell for approximately \$10,000 less, according to Craig Turner, vice-president of Cipher's V-tape cartridge business unit.

AS/400 users have long been

between Lotus and IBM that was reached in April 1987, just moments before the announcement of 1-2-3/G.

According to sources, a separate version of 1-2-3/G that will be sold exclusively by IBM, 1-2-3/G comes equipped with pull-down menus and dialog boxes. With the Blueprint communications specification, 1-2-3/G can generate queries that work against an IBM OS/2 Extended Edition database, officials said.

Lotus' rival Microsoft Corp. says its Excel spreadsheet will also tie into Officewinder using such services as electronic mail. Lotus executive Vice-President Frank King argued that having 1-2-3/M on the back end will allow 1-2-3 users to access host services such as IBM's Professional Office System mainframe printers.

unhappy with the IBM tape drive, which they say prevents them from efficiently backing up data [CW, May 8].

While neither IBM nor Cipher would give details on their relationship, it is believed that Cipher was developing a high-performance tape drive for the AS/400 last year and the deal fell through shortly before IBM announced its new mid-range computers.

The Cipher tape drive will offer data transfer rates of 450K and 900K bytes/sec. In addition, it uses the more advanced tape cartridge technology that can store up to 570MB bytes of data per cartridge, Turner said. The company will introduce a cartridge with a 1.25-hbyte capacity by year's end.

## Users frown at IBM's Netview presentation

BY ELISABETH HORWITT  
CW STAFF

BOSTON — It was standing room only at a series of demonstrations that IBM held for customers here last week, providing a tantalizing but ultimately frustrating view of the long-awaited graphics-based Netview user interface.

A limited prototype version of a possible future product went through its paces at the First International Symposium on Integrated Network Management. But it caused one user to ask why "a company as big as IBM should be so behind the curve" in terms of functionality. No vendor has the total solution yet, but IBM is behind the power curve."

The user, who requested anonymity, is a technical manager at a Fortune 500 manufacturing company that is "one of the biggest IBM customers" and currently uses Netview in a number of its installations.

The basic components of the system provided few surprises. The windowed, graphics-based, mouse-driven interface will be based on elements of IBM's System Applications Architecture, a spokesman said, including OS/2 Extended Edition, Common User Access and OS/2 Presentation Manager.

The system will include a number of features that are offered by competing network management platforms, such as a geographic presentation of the network with a zoom-in feature that allows the user to bring up the status of networking devices within a given network node.

**iddle me this**  
However, the prototype apparently generated more questions than it answered. One user asked, for instance, how the interface would be used to manage multivendor network management configurations. The IBM spokesman indicated that "our solution" would be to call up other

IBMs' future interface will be migrated to other IBM network management systems, including those provided in VTAM and OS/400, a spokesman said.

IBM's future interface will be migrated to other IBM network management systems, including those provided in VTAM and OS/400, a spokesman said.

Second-class postage paid at Framingham, Mass., and additional mailing offices. Computerworld (ISSN 0810-4812) is published weekly, with a single component issue for the last week in December and the first week in January of 1989 by CW Publishing Inc., 375 Concourse Road, Box 917, Framingham, Mass. 01781-9171.

Computerworld is published on 35 mm microfilm through University Microfilms Int'l. Periodical Entry Dept., 300 Zeeb Road, Ann Arbor, Mich. 48106. Computerworld is indexed bi-monthly, if available, by the American Periodical Catalog, 27 Congress Street, Salem, MA 01970.

Photocopy rights permission to photocopy for internal or personal use or the internal or personal use of specific clients is granted by CW Publishing Inc. for libraries and other users registered with Copyright Clearance Center, Inc., 27 Congress Street, Salem, MA 01970.

Reprints over 100 copies and permission to reprint must be purchased from Shostak Reprint, P.O. Box 1949, Greenwich, Conn. 06830. Requests for reprints must be received within 60 days of issue date.

Subscription rates: one year—\$100 U.S.; one year—\$110 Canada, Mexico, Central & South America—\$120 Australia, £250.00 (air-speeded) U.K.; one year—\$125 Europe, £150. All other areas—\$250 U.S. Four week notice is required for change of address.

Allow six weeks for new subscription service to begin.

## TRENDS

## Technical workstations

**N**othing is quiet on the workstation front these days. MIPS and mergers are making headlines, and the workstation's rivalry with the minicomputer is mounting. A crossfire of price/performance-conscious machines continues as vendors recognize they must keep up their attack or lose valuable ground.

In 1985, Apollo Computer, Inc. commanded the field of technical workstations. Since then, Sun Microsystems, Inc. ousted the faltering Apollo, while Hewlett-Packard Co. and Digital Equipment Corp. swapped third and fourth places.

But the landscape is about to shift again. HP's pending buyer of Apollo will be the new command vendor to the top of the market. Based on year-end 1988 figures from International Data Corp. (IDC) in Framingham, Mass., the duo should claim some 35% of installed workstations, just sneaking past Sun's 34%.

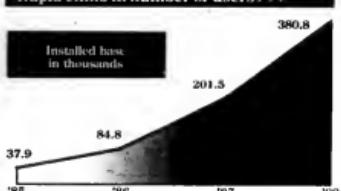

In vendors' intensified quests to offer more for less, workstation costs have dropped, and they should level off, said IDC analyst Vicki Brown. Though entry prices may fall, average costs, including service and maintenance, will not drop dramatically as big players like DEC take a foothold in the market.

The approximate entry-level price, Brown said, ranges from \$4,600 to \$5,000.

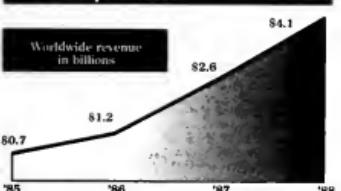

IDC defines technical workstations as 32-bit single-user systems that are distinguished from personal computers in terms of integer and floating-point performance and networking capability.

Laura O'Connell

## Rapid climb in number of users

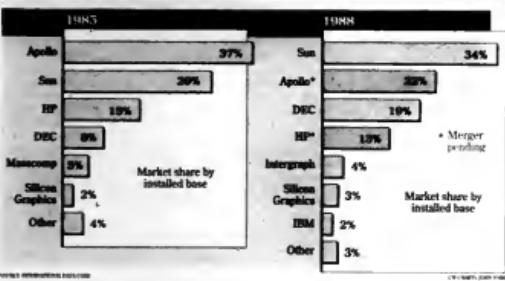

## ... and expenditures

## As popularity rises, costs drop

## Tentative HP-Apollo deal will reshuffle playing field

## INSIDE LINES

Decnet deluxe! The words of Chairman Ken were buzzing around DEC's internal E-mail system last week. "If employees nowadays want security, they should go work for the Post Office," Olsen was reported to have told a gathering at DEC's Site 10 of the Company meeting; out of context, the remark sounds like Olsen is preparing the company for impending layoffs. In truth, he was making a point that the company is no longer the workplace it once was and company can't really be complacent. Olsen reportedly followed up that comment with a fast denial that layoffs would occur anytime in the near future at DEC and said that although DEC does not have a no-layoff policy, layoffs "should be avoided at all costs, even if it is uncomfortable for the company." Meanwhile, according to internal sources, the company will freeze all salaries for three months beginning in July.

Yo-Yo Man. Last week's Senate hearing on computer viruses got off to an unusual start as star witness Clifford Stoll babbled through the stateless hearing room playing with a yo-yo, apparently working off some nervous energy or emulating Tommy Smothers. The frisky-haired computer astronomer, who tracked down a West German computer spy ring, later provided some highly animated testimony punctuated with humor, ditties against "the slime who broke into my computer" and tales of how 24-hour monitoring of the West German hackers meant "my weekends were wasted." Stoll added, "My sweetheart, the time was not wasted."

Look for specifics. Last October, IBM promised major improvements for its mainframe system, the 3480, sometime this year. Last week, an IBM spokesman said the company would make good on that promise in the first half of 1989. That gives it about five more weeks to come through. Last year, IBM said it intended to boost its 3480 data cartridge capacity by 300% to 500% while boosting overall 3480 performance by as much as 50%.

Tenaciously. Compaq will announce today in New York one of the most expensive personal computer lines, which will be based on Intel's 33-MHz 80386 microprocessor. Labeled the 386/33 series, the systems will be positioned as PC local-area network servers and will come in three configurations: a Model 80, 320 and 640. The systems will support 80M-, 320M- and 640M-byte disk drives, respectively. Prices will start at \$10,499 and climb to \$17,999. Standard features include 2M bytes of memory and one 5½-in. 1.2M-byte drive. The system will have 640K bytes of controller cache and six slots to support 8- or 16-bit adapters, but not 32-bit cards. Novell had been expected to be on hand, but the companies are still trying to hammer out an agreement to co-develop and market a version of Netware 386 optimized for Compaq systems.

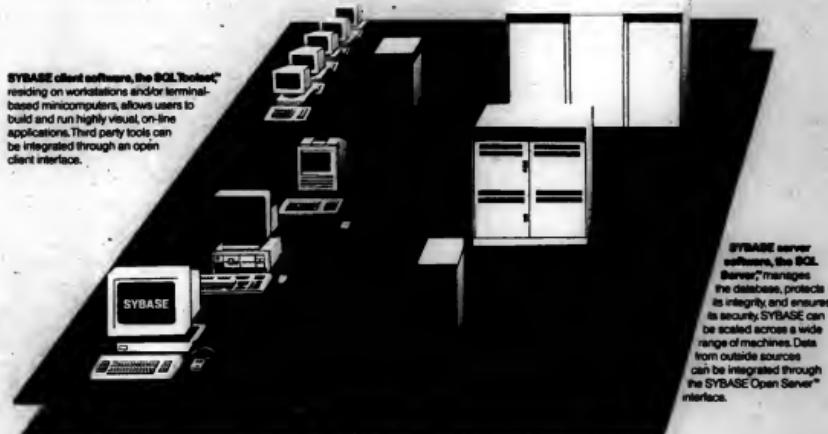

Spare-leaf. When the fire alarm sounded at Boston's Hynes Auditorium during last week's Engineering Workstations Conference, barely a handful of the several hundred persons attending the show headed for the exits. Most kept right on walking the floor, seemingly oblivious to the honking alarms and broadcast announcements to leave. Who says workstation users don't think they're invincible?

Georgia peaches. Among the talk going around about DEC at the recent Denspo South show in Atlanta: Ultrix support is expected for the Microvax 3300 and 3400 next month, the VAX 6400 is on target for July delivery, high-end models of the mainframe Ardenne line will have an integral vector accelerator when that line is announced this fall, and the VAX 8200 and 8300 are scheduled to be retired Sept. 26, clearing the way for DEC to unveil multiprocessor Microvaxes.

Now, Mr. Olsen, before you start levelling blasts of the press, you'd better start monitoring your E-mail. You don't like what we've got deal with that, but it's your employer who's been spreading your words from screen to screen. Let's make sure we've got our attorney to our bulletin board (508-626-0214, -0220 or -0160), and we'll monitor the traffic for you. Or call News Editor Peter Bartels at 800-343-6474 or 508-679-0700 and set the record straight.

# SYBASE Client/Server Architecture...

SYBASE client software, the SQL Tools™, residing on workstations and terminal-based minicomputers, allows users to build and run highly visual, on-line applications. Third party tools can be integrated through an open client interface.

SYBASE server software, the SQL Server™ manages the database, protects its integrity and ensures its security. SYBASE can be scaled across a wide range of machines. Data from outside sources can be integrated through the SYBASE Open Server™ interface.

## Increases Your Competitive Edge

Your on-line, mission critical applications manage real-time information to cut costs and improve efficiency. SYBASE is the first SQL-based relational database management system (RDBMS) built to handle these demanding applications. Only SYBASE client/server architecture, with its programmable server, delivers:

**Scalable High Performance** for dozens to hundreds of users updating and querying large databases.

**Server Enforced Integrity** for improved control and maintainability of critical information.

**High Application Availability** thanks to on-line maintenance and software-based fault tolerance.

**Open Distributed DBMS** to transparently integrate heterogeneous hardware and software systems.

**Window-Based Tools** for increased productivity with powerful, graphical, object-oriented tools.

## Delivers Enterprise-Wide Benefits

SYBASE gives information managers hardware independence, including a transparent migration path from host-based applications to the workstation and distributed computing technologies of the 1990s.

SYBASE gives developers faster development cycles, simplified application maintainability, and greater application reliability because integrity and business rules are centralized in the programmable server.

SYBASE gives end users powerful decision support tools and a graphical application interface that's intuitively easy to use.

## On a Variety of Powerful Platforms

Ask about SYBASE for VAX/VMS, Sun/UNIX, Stratus/UNIX, Pyramid/UNIX, OS/2, PC/DOS, HPUX, IBM RT/UX, NeXT/Mach, VAX/UNIX Sys V, AT&T/UNIX, Apollo/UNIX, and Macintosh HyperCard.

Microsoft and Ashton-Tate selected SYBASE for the OS/2-based SQL Server. NeXT and Stratus selected SYBASE to be shipped with every computer system. And hundreds of companies in financial services, telecommunications, manufacturing and government/defense have chosen SYBASE.

Find out how SYBASE can effectively manage your on-line applications. Use the coupon below or call 415/596-3400 about a free SYBASE seminar.

LET THERE BE  
SAA.

O.K.

## Some of our best ideas come out of the blue.

IBM has spoken.

And what they've said can be summarized in three simple but highly important letters: SAA (Systems Application Architecture).

SAA is a set of standards that finally allows far integration of computer systems.

And as IBM goes, so goes MSA. Therefore we are proud to be the first major software company committed to delivering the most extensive line of SAA-compliant software in the industry. BrightView™ applications software already complies with SAA's most advanced component, Common User Access.

By harnessing the power of cooperative processing, BrightView allows intelligent work stations to be something they never truly were before: intelligent. It does this by unleashing the power and potential within the work station, freeing you from dependence on valuable mainframe time, and dramatically increasing the efficiency of all application users.

This efficiency is further heightened by BrightView's CUA compliance, which yields a friendly, consistent look and feel to work stations, maximizing your investment in personnel and hardware. All of which makes it a rather brilliant idea to call Robert Carpenter at 404-239-2000.

IBM believes SAA is the future. We recommend our software to anyone intending to spend some time there.
